

ABSTRACT**CONNECTION GAME SYSTEM AND METHOD OF USING THE SAME**

A connection game system has a game server (10), an operating machine (11) and multiple player interfaces (12). The operating machine (11) is electrically connected to the game server (10). The player interfaces (12) are electrically connected to the game server (10) to allow multiple players to input signals and to display game information to the players. The game server (10) has a processing program for controlling processes of a game and providing a choosing function for allowing one of the players to serve as a banker for the game. With such a system, a player is allowed to be a banker and the system is versatile and fair in use.
