Device And Method For Product Delivery Interception

ABSTRACT

Herein disclosed is a method and system to perform product delivery interception. In one implementation, a product delivery interceptor receives, from a purchaser, a request to determine availability of a product. The product delivery interceptor identifies a recipient of the product and transmits a bid for the product for consideration by the recipient. The product delivery interceptor acquires the recipient response to the bid and conveys an instruction to reroute delivery of the product to the purchaser if the recipient response indicates acceptance of the bid.
