PASSENGER BOARDING BRIDGE

ABSTRACT

A passenger boarding bridge includes: a tunnel unit including a plurality of tunnels that are fitted together in a nested manner, the tunnel unit being extendable and retractable in a front-rear direction; a floor member that forms a walkway of an outer tunnel of the tunnels that are adjacent to each other; and a partitioning member coupled to an inner tunnel of the tunnels that are adjacent to each other. The partitioning member partitions a tunnel space and an end region of the outer tunnel from each other, the tunnel space being a space through which a passenger passes on the floor member, the end region of the outer tunnel extending along an end portion of the floor member in the front-rear direction, and the partitioning member moves to follow extension and retraction of the tunnel unit.
