

ABSTRACT

[ABSTRACT]

[OBJECT] To simplify a device configuration of a fueling station system by linking a fueling device and a server by using a function of a mobile terminal to perform fueling and settlement.

[Solution] A fueling station system 1 in which when a user reads, with a mobile terminal 4, an identification code 2c that includes fueling station information and is provided in a fueling device, user information and fueling station information are transmitted from the mobile terminal to a server (3), and the server that has received the user information and the fueling station information transmits a fueling permission signal to the fueling device, and the fueling device becomes operable when the fueling device receives the fueling permission signal. When receiving fueling information and a fueling end signal from the fueling device, the server generates settlement information on the basis of the fueling information, and the server can store user information, fueling station information, fueling information, and settlement information in association with each other.
