SYSTEM AND METHOD OF MANAGING APPLICATION UPDATES

ABSTRACT

A method for updating an application on a computing device includes receiving, at the computing device, a notification that an update is available for the application, then responsive to the notification, obtaining, over a first time period having a predetermined length, one or more stability indicators for the application from one or more sources, the one or more stability indicators being generated after the notification is received, and automatically executing the update for the application after the expiration of the first time period when the one or more stability indicators satisfy one or more predetermined vetting rules.
