BENZIMIDAZOLES THAT ARE USEFUL IN TREATING SEXUAL DYSFUNCTION

TECHNICAL FIELD

The present invention relates to the use of benzimidazoles and compositions containing these compounds for the treatment of sexual dysfunction.

BACKGROUND OF THE INVENTION

Preclinical evidence indicates that dopamine (DA) plays a role in penile erection in mammals. Sexual stimulation can be initiated by sensory (erotic) information reaching the cerebral cortex in mammals. The cerebral cortex has extensive neuronal connections with limbic structures like the amygdala, as well as midbrain structures like the periaqueductal gray (PAG) and the hypothalamus. Two important nuclei in the hypothalamus are the medial preoptic area (MPOA) and the paraventricular nucleus (PVN). The MPOA and PVN nuclei play a critical role in sexual behavior as bilateral lesions of these areas completely eliminate male sexual behavior. The incerto-hypothalamic dopaminergic pathway that innervates the PVN and the MPOA nuclei has been associated with the pro-erectile effect of DA agents. Systemic administration of DA receptor agonists like apomorphine ((6aR) 5,6,6a,7-tetrahydro-6-methyl-4H-dibenzo[de,g]quinoline-10,11-diol), quinpirole and (-) 3-(3-hydroxyphenyl)-N-propylpiperidine (3-PPP) facilitate penile erection in rats, an effect blocked by haloperidol, a central DA antagonist. As the erectogenic effect can not be blocked by domperidone, a peripheral DA antagonist, it is believed that the pro-erectile effect of DA agonists is centrally mediated (Andersson K and Wagner G, Physiology of penile erection, Physiol Rev (1995) 75:191-236; deGroat W and Booth A, Neural Control of Penile Erection, in: Nervous control of urogenital system, Vol. 3, (ed. Maggi, C) (1993) p. 467-524, Hardwood Academic Publishers, Chur, Switzerland; and Moreland RB, Nakane M, Hsieh G and Brioni JD, Prospectives for Pharmacotherapy of Male Erectile Dysfunction, Curr Opinion CPNS Invest Drugs (2000) 2:283-302).

Clinical data also indicates that DA systems in the CNS play a role on the regulation of male sexual behavior as indicated by the sexual stimulatory effect of L-dopa in Parkinson's patients and by the pro-erectile effect of apomorphine in humans (Morales A, Geaton J, Johnston B and Adams M, Oral and Topical Treatment of Erectile Dysfunction: present and future, in: Urologic Clinics of North America, (1995) Vol. 22, p. 879-886; Padma-Nathan H, Auerbach S, Lewis R, Lewand M and Perdok R , Efficacy and safety of apomorphine SL vs.

placebo for male erectile dysfunction (MED), Urology (1999) 161:214 (abstract 821); and Dula E, Keating W, Siami P, Edmonds A, O'Neil J, Efficacy and safety of fixed-dose and dose-optimization regimens of sublingual apomorphine versus placebo in men with erectile dysfunction, Urology (2000) 56:130-135).

DA receptors belong to a superfamily of protein receptors that signal across the cell membrane by coupling to intracellular GTP-binding proteins. Several G proteins have been identified (including Gs, Gq and Gi) that lead to specific intracellular events (Milligan G and Rees S, Chimaeric G proteins: their potential use in drug discovery, Trends Pharmacol Sci (1999) 20:118-124).

There are five known DA receptors which are classified into two groups, D_1-like and D_2-like. The D_1-like receptors include D_1 and D_5. The D_2-like receptors include D_2, D_3 and D_4 (Missale C, Nash S, Robinson S, Jaber M and Caron M, Dopamine receptors: from structure to function, Physiol Rev (1998) 78:189-225). The D_1-like family receptor subtypes are G_s-coupled and can activate adenylate cyclase. The D_2-like family receptor subtypes are G_i-coupled and they increase intracellular calcium level and inhibit adenylate cyclase.

The D_1-like family members are G_s-coupled receptors that can activate adenylate cyclase. The D_1 receptor is the most abundant and widespread DA receptor in the CNS both by mRNA expression and by immunohistochemical studies (Vallone D, Picetti R and Borreli E, Structure and function of dopamine receptors, Neurosci Biobehav Rev (2000) 24:125-132). It is found in the striatum, nucleus accumbens and olfactory tubercle as well as the limbic system, hypothalamus and thalamus. The D_1 receptor expression has been reported in the heart and kidney, and despite that the function of these peripheral D_1 receptors remains to be clarified, its role on the control of hemodynamic variables has been confirmed. The D_5 receptor, while having a higher affinity for DA than the D_1 receptor, is sparsely distributed in the CNS with no evidence of expression outside the CNS.

The D_2-like family members are G_i coupled receptors that inhibit adenylate cyclase and increase intracellular calcium levels. The D_2 receptor is the most abundant of the D_2-like receptors and is located in brain areas such as the striatum and substantia nigra, and in peripheral areas such as the heart, pituitary gland and kidney. The D_3 receptor is found abundantly in the islands of Calleja with distinct cluster populations in the ventral striatum/nucleus accumbens regions, olfactory tubercle, dendate gyrus and striatal cortex (Suzuki M, Hurd Y, Sokoloff P, Schwartz J and Sedwall G, D_3 dopamine receptor mRNA is widely express in human brain, Brain Res (1998) 779:58-74).

Expression of the D_4 receptor has been documented by in situ RNA hybridization and immunohistochemical studies. Recently, studies revealed that D_4 expression is highest in the entorhinal cortex, lateral septal nucleus, hippocampus and the medial preoptic area of the hypothalamus (Primus R, Thurkauf A, Xu J, Yevich E, Mcinerney S, Shaw K, Tallman J and Gallagher D, Localization and characterization of dopamine D_4 binding sites in rat and human brain by use of the novel D_4 receptor-selective ligand [^{3}H]NGD 94-1, J Pharmacol Exp Ther (1997) 282:1020-1027). Localization of D_4 is distinct from the distribution of D_2 in the brain, as D_2 receptors are most abundant in striatal areas. The expression of D_4 receptors in the MPOA of the hypothalamus is of importance to the facilitation of penile erection in view of the role of the hypothalamus as an area of integration between the cortex and the spinal pathways. The participation of D_4 receptors in other CNS regions, thalamic, subthalamic and spinal can not be excluded.

In Vivo Data

Rat Penile Erection Model

Wistar rats were used as a primary animal model to study penile erection in vivo. All experiments were carried out between 9:00 AM and 3:00 PM in a diffusely illuminated testing room with a red light. Animals were weighed and allowed to adapt to the testing room for 60 minutes before the beginning of experiments. Rats were placed individually in a transparent cage (20x30x30 cm) after drug injection. The number of penile erections were recorded by direct observation for a period of 60 minutes after drug dosing, and the number of animals exhibiting 1 or more erections is expressed as incidence (%).

Emesis Model in Ferrets

Male Fitch ferrets (body weights 1.0-1.5 kg) were obtained from Marshall Farms. Ferrets were fasted overnight before experimentation. Apomorphine or a compound of the present invention was administrated subcutaneously; animals were placed individually in observation cages and the drug-induced emesis and signs of nausea were determined (by direct observation) for a period of 90 minutes following drug injection. Nausea was characterized by behaviors such as licking, gagging, backing, head burying, and intense abdominal grooming. Emesis was usually preceded by these behaviors and was characterized by rhythmic abdominal contractions which were associated with vomiting or retching movement.

Sterile saline was used as vehicle. Six animals were used per dose. Apomorphine was used as a positive control in Table 3 at a dose of 0.3 μmol/kg which resulted in an 100 % incidence of ferrets exhibiting emesis.

As shown in Table 3, 2-[(4-pyridin-2-ylpiperazin-1-yl)methyl]-1H-benzimidazole did not induce emesis in ferrets after subcutaneous administration.

Apomorphine has been included as a positive control in these studies. These data indicate that 2-[(4-pyridin-2-ylpiperazin-1-yl)methyl]-1H-benzimidazole offers a significant advantage over apomorphine, as it facilitates penile erection without inducing emesis.

Compounds of the present invention, in particular 2-[(4-pyridin-2-ylpiperazin-1-yl)methyl]-1H-benzimidazole, can be used in combination with phosphodiesterase 5 inhibitors including, but not limited to, sildenafil or vardenafil as method of treating sexual dysfunction in a mammal.

Compounds of the present invention, in particular 2-[(4-pyridin-2-ylpiperazin-1-yl)methyl]-1H-benzimidazole, can be used in combination with an adrenergic receptor antagonist including, but not limited to, terazosin, prazosin or tamsulosin as method of treating sexual dysfunction in a mammal.

Compounds of the present invention, in particular 2-[(4-pyridin-2-ylpiperazin-1-yl)methyl]-1H-benzimidazole, are dopamine agonists and therefore are useful for the treatment of female sexual dysfunction, attention deficit hyperactivity disorder, Alzheimer's disease, drug abuse, Parkinson's disease, anxiety, schizophrenia, mood disorders and depression as described in The dopamine D_4 receptor: a controversial therapeutic target. N.J. Hrib. Drugs of the future 25:587-611 (2000); Dopamine and sexual behavior. M. Melis and A. Argiolas. Neuroscience and Biobehavioral Reviews 19:19-38 (1995); and Dopamine receptors: from structure to function. C. Missale, S.R. Nash, S. Robinson, M. Jabber and M. Caron. Physiological Reviews 78: 189-225 (1998).

Compounds of the present invention, in particular 2-[(4-pyridin-2-ylpiperazin-1-yl)methyl]-1H-benzimidazole, are dopamine agonists and therefore are useful for the treatment of cardiovascular disorders. Dopamine and dopaminergic agents have been reported to exert pharmacologically significant cardiovascular effects on blood pressure and heart rate and can be useful in the treatment of cardiovascular disorders (Chen FF, and Lin MT, Effects of dopamine, apomorphine gamma-hydroxybutyric acid, haloperidol, and pimozide on reflex bradycardia in rats, Journal of Pharmacology and Experimental

Therapeutics (1980) 214: 427-432), and it has been reported that primate data support the potential clinical utility of dopamine receptor agonists in treating cardiovascular disease (Hahn, RA and MacDonald BR, Primate cardiovascular responses meditated by dopaminine receptors: effects of N,N-dipropyldopamine and LY171555, Journal of Phamacology and Experimental Therapeutics (1984) 229: 132-138.

Compounds of the present invention, in particular 2-[(4-pyridin-2-ylpiperazin-1-yl)methyl]-1H-benzimidazole, are dopamine agonists and therefore are useful for the treatment of inflammation. Dopaminergic agents can exert anti-inflammatory effects and be useful for the treatment of diseases where inflammation plays a deleterious role (Bendele AM, Spaethe SM, Benslay DN, and Bryant HU, Anti-inflammatory activity of pergolide, a dopamine receptor agonist, in Journal of Pharmacology of Pharmacology and Experimental Therapeutics (1991) 259: 169-175. Dopaminergic agents can also be of utility in the treatment of cancers (Lissoni P, Mandala M, Giani L, Malugani F, Secondino S, Zonato S, Rocco F, Gardani G, Efficacy of Bromocriptine in the Treatment of Metastatic Breast Cancer and Prostate Cancer-related Hyperprolactinemia, Neuroendocrinology Letters (2000) 21: 405-408).

The term agonist, as used herein, refers to a compound that interacts with one or more dopamine receptor subtypes and elicits an observable intracellular biochemical response. The response is measured relative to a full agonist like dopamine.

The term "pharmaceutically acceptable carrier," as used herein, means a non-toxic, inert solid, semi-solid or liquid filler, diluent, encapsulating material or formulation auxiliary of any type. Some examples of materials which can serve as pharmaceutically acceptable carriers are sugars such as lactose, glucose and sucrose; starches such as corn starch and potato starch; cellulose and its derivatives such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; excipients such as cocoa butter and suppository waxes; oils such as peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil and soybean oil; glycols; such a propylene glycol; esters such as ethyl oleate and ethyl laurate; agar; buffering agents such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water; isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives

and antioxidants can also be present in the composition, according to the judgment of the formulator.

The present invention provides for pharmaceutical compositions which comprise compounds of the present invention formulated together with one or more non-toxic pharmaceutically acceptable carriers. The pharmaceutical compositions can be formulated for oral administration in solid or liquid form, for parenteral injection or for rectal administration.

Further included within the scope of the present invention are pharmaceutical compositions comprising one or more dopamine agonists prepared and formulated in combination with one or more non-toxic pharmaceutically acceptable compositions. The pharmaceutical compositions can be formulated for oral administration in solid or liquid form, for parenteral injection or for rectal administration.

The pharmaceutical compositions of this invention can be administered to humans and other mammals orally, sublingually, rectally, parenterally , intracisternally, intraurethrally, intravaginally, intraperitoneally, topically (as by powders, ointments or drops), bucally or as an oral or nasal spray. The term "parenterally," as used herein, refers to modes of administration which include intravenous, intramuscular, intraperitoneal, subcutaneous, intraarticular injection and infusion.

Preferred administration to humans is oral or sublingual.

Pharmaceutical compositions of this invention for parenteral injection comprise pharmaceutically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions and sterile powders for reconstitution into sterile injectable solutions or dispersions. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (propylene glycol, polyethylene glycol, glycerol, and the like), suitable mixtures thereof, vegetable oils (such as olive oil) and injectable organic esters such as ethyl oleate. Proper fluidity may be maintained, for example, by the use of a coating such as lecithin, by the maintenance of the required particle size in the case of dispersions, and by the use of surfactants.

These compositions may also contain adjuvants such as preservative agents, wetting agents, emulsifying agents, and dispersing agents. Prevention of the action of microorganisms may be ensured by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, and the like. It may also be desirable to include isotonic agents, for example, sugars, sodium chloride and the like. Prolonged absorption of

the injectable pharmaceutical form may be brought about by the use of agents delaying absorption, for example, aluminum monostearate and gelatin.

In some cases, in order to prolong the effect of a drug, it is often desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle.

Suspensions, in addition to the active compounds, may contain suspending agents, as, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar, tragacanth, and mixtures thereof.

If desired, and for more effective distribution, compounds of the present invention can be incorporated into slow-release or targeted-delivery systems such as polymer matrices, liposomes, and microspheres. They may be sterilized, for example, by filtration through a bacteria-retaining filter or by incorporation of sterilizing agents in the form of sterile solid compositions, which may be dissolved in sterile water or some other sterile injectable medium immediately before use.

Compounds of the present invention may also be in micro-encapsulated form, if appropriate, with one or more excipients as noted above. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings, release controlling coatings and other coatings well known in the pharmaceutical formulating art. In such solid dosage forms the active compound can be admixed with at least one inert diluent such as sucrose, lactose, or starch. Such dosage forms may also comprise, as is normal practice, additional substances other than inert diluents, e.g., tableting lubricants and other tableting aids such a magnesium stearate and microcrystalline cellulose. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents. They may optionally contain opacifying agents and can also be of such composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract in a delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes.

Injectable depot forms are made by forming microencapsulated matrices of the compounds of the present invention in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of compounds of the present invention to polymer and the nature of the particular polymer employed, the rate of compounds of the present invention can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides) Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissues.

The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium just prior to use.

Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic, parenterally acceptable diluent or solvent such as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, a compound or compounds of the present invention are mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or calcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid; b) binders such as carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidinone, sucrose, and acacia; c) humectants such as glycerol; d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate; e) solution retarding agents such as paraffin; f) absorption accelerators such as quaternary ammonium compounds; g) wetting agents such as cetyl alcohol and glycerol monostearate;) absorbents such as kaolin and bentonite clay; and i) lubricants such as talc, calcium stearate, magnesium

stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract in a delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes.

Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to compounds of the present invention, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof.

Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

Dosage forms for topical or transdermal administration of a compound of this invention include ointments, pastes, creams, lotions, gels, powders, solutions, sprays, inhalants or patches. The active component is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or buffers as may be required. Ophthalmic formulation, ear drops, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

The ointments, pastes, creams and gels may contain, in addition compounds of the present invention, excipients such as animal and vegetable fats, oils, waxes, paraffins, starch, tragacanth, cellulose derivatives, polyethylene glycols, silicones, bentonites, silicic acid, talc and zinc oxide, or mixtures thereof.

Powders and sprays can contain, in addition to compounds of the present invention, excipients such as lactose, talc, silicic acid, aluminum hydroxide, calcium silicates and polyamide powder, or mixtures of these substances. Sprays can additionally contain customary propellants such as chlorofluorohydrocarbons.

Compounds of the present invention can be used in the form of pharmaceutically acceptable salts derived from inorganic or organic acids. By "pharmaceutically acceptable salt" is meant those salts which are, within the scope of sound medical judgement, suitable for use in contact with the tissues of mammals, in particular humans, without undue toxicity, irritation, allergic response and the like and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well-known in the art. For example, S. M. Berge et al. describe pharmaceutically acceptable salts in detail in J. Pharmaceutical Sciences, 1977, 66: 1 et seq. The salts can be prepared in situ during the final isolation and purification of the compounds of the invention or separately by reacting a free base function with a suitable organic acid. Representative acid addition salts include, but are not limited to acetate, adipate, alginate, citrate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, camphorate, camphorsufonate, digluconate, glycerophosphate, hemisulfate, heptanoate, hexanoate, fumarate, hydrochloride, dihydrochloride, trihydrochloride, hydrobromide, hydroiodide, 2-hydroxyethansulfonate (isethionate), lactate, maleate, methanesulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, pamoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, succinate, sulfate, bis(tartrate), tartrate, (L) tartrate, bis((L) tartrate), (D) tartrate, bis((L) tartrate), (DL) tartrate, bis((DL) tartrate), meso-tartrate, bis(meso tartrate), thiocyanate, phosphate, glutamate, bicarbonate, p-toluenesulfonate and undecanoate.

Preferred pharmaceutically acceptable salts of the present invention are bis((D)tartrate), bis((DL)tartrate), bis(bromide), bis(sulfate), bis(phosphate), fumarate and tris(hydrochloride).

A most preferred pharmaceutically acceptable salt of the present invention is the bis((L)tartrate).

The term "pharmaceutically acceptable prodrug" or "prodrug,"as used herein, represents those prodrugs of compounds of the present invention which are, within the scope of sound medical judgement, suitable for use in contact with the tissues of mammals, in particular humans, without undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable benefit/risk ratio, and effective for their intended use.

Prodrugs of compounds of the present invention may be transformed in vivo to compounds of the present invention, for example, by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems, V. 14 of the A.C.S. Symposium Series, and in Edward B. Roche, ed., Bioreversible Carriers in Drug Design, American Pharmaceutical Association and Pergamon Press (1987). For example, compounds of formula (I) substituted at R_E with alkoxycarbonyl, alkyl, alkylcarbonyl, arylcarbonyl, cycloalkylcarbonyl, heterocyclecarbonyl or (NZ_1Z_2)carbonyl are prodrugs. In particular, isobutyl 2-[(4-pyridin-2-ylpiperazin-1-yl)methyl]-1H-benzimidazole-1-carboxylate; 2-[(4-pyridin-2-ylpiperazin-1-yl)methyl]-1-(pyrrolidin-1-ylcarbonyl)-1H-benzimidazole; and N,N-dimethyl-2-[(4-pyridin-2-ylpiperazin-1-yl)methyl]-1H-benzimidazole-1-carboxamide are representative examples of prodrugs of compounds of formula (I).

The term "pharmaceutically acceptable ester" or "ester," as used herein, refers to esters of compounds of the present invention which hydrolyze in vivo and include those that break down readily in the human body to leave the parent compound or a salt thereof. Examples of pharmaceutically acceptable, non-toxic esters of the present invention include C_1-to-C_6 alkyl esters and C_5-to-C_7 cycloalkyl esters, although C_1-to-C_4 alkyl esters are preferred. Esters of the compounds of formula (I) may be prepared according to conventional methods.

The term "pharmaceutically acceptable amide" or "amide," as used herein, refers to non-toxic amides of the present invention derived from ammonia, primary C_1-to-C_6 alkyl amines and secondary C_1-to-C_6 dialkyl amines. In the case of secondary amines, the amine may also be in the form of a 5- or 6-membered heterocycle containing one nitrogen atom. Amides derived from ammonia, C_1-to-C_3 alkyl primary amides and C_1-to-C_2 dialkyl secondary amides are preferred. Amides of the compounds of formula (I) may be prepared according to conventional methods.

Dosage forms for topical administration of compounds of the present invention may include powders, sprays, ointments and inhalants. The active compound is mixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives, buffers or propellants which can be required. Opthalmic formulations, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

Actual dosage levels of active ingredients in the pharmaceutical compositions of this invention can be varied so as to obtain an amount of the compound or compounds of the

present invention which are effective to achieve the desired therapeutic response for a particular patient, compositions and mode of administration. The selected dosage level will depend upon the activity of the particular compound, the route of administration, the severity of the condition being treated and the condition and prior medical history of the patient being treated. However, it is within the skill of the art to start doses of the compounds of the present invention at levels lower than required for to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

The present invention contemplates compopunds of the present invention either chemically synthesized or formed for example, by administration of a prodrug and subsequent in vivo biotransformation to a compound of the present invention.

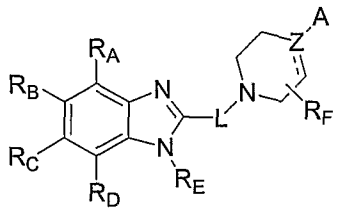

When used in the above or other treatments, a therapeutically effective amount of compounds of the present invention can be employed in pure form or, where such forms exist, in pharmaceutically acceptable salt or prodrug form. Alternatively, compounds of the present invention can be administered as a pharmaceutical composition containing a compound or compounds of the present invention in combination with one or more pharmaceutically acceptable excipients. The phrase "therapeutically effective amount" of the compound of the present invention means a sufficient amount of a compound or compounds of the present invention to treat sexual dysfunction, at a reasonable benefit/risk ratio applicable to any medical treatment. It will be understood, however, that the total daily usage of a compound or compounds of the present invention and compositions thereof will be decided by the attending physician within the scope of sound medical judgement. The specific therapeutically effective dose level for any particular patient will depend upon a variety of factors including the sexual dysfunction being treated and the severity of the sexual dysfunction; activity of the compound or compounds of the present invention employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the compound or compounds of the present invention; the duration of the treatment; drugs used in combination or coincidental with a compound or compounds of the present invention; and like factors well known in the medical arts. For example, it is well within the skill of the art to start doses of an agonist at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

The total daily dose of compounds of the present invention administered to a human or other mammal may range from about 0.001 to about 30 mg/kg/day. For purposes of oral

administration, more preferable doses can be in the range of from about 0.01 to about 10 mg/kg/day. For purposes of sublingual administration, more preferable doses can be in the range of from about 0.001 to about 0.15 mg/kg/day. If desired, the effective daily dose can be divided into multiple doses for purposes of administration; consequently, single dose compositions may contain such amounts or submultiples thereof to make up the daily dose.
