

PERIPHYTON FILTRATION PRE- AND POST-TREATMENT SYSTEM AND METHOD

CROSS-REFERENCE TO RELATED APPLICATION

This application claims priority to provisional application 60/285,001, filed
5 April 19, 2001, entitled "Periphyton Filtration Pretreatment System and Method."

BACKGROUND OF THE INVENTION

The present invention relates to systems and ~ method for improving water
quality, and, more particularly; to such systems and methods for bioremediating
water with an attached algal colony, and, most particularly, to treating water
10 against undesired toxins, microorganisms, and other water-borne pollutants in
concert with an attached algal colony.

Algae comprise a group of plants, existing in approximately 18,000
different species, whose primary nutrients include carbon, nitrogen, and
phosphorus, as well as a suite of micronutrients essential to plant growth.

15 The removal of contaminants from wastewater and ground water has
become an important problem in restoring ecological balance to polluted areas.
It is known that some algal species are capable of absorbing heavy metals into
their cell walls, thus reducing their toxic effects on the environment. Algae can
also take up nutrients and micronutrients that may be present in overabundance,
20 such as phosphorus, potassium, nitrogen, iron, aluminum, and calcium, and can
thus be utilized to remediate an ecosystem. Such remediation can occur when
water flows over stationary algae, also absorbing carbon dioxide and releasing
oxygen in the process as a result of respiration and photosynthesis. Further, the
water passing over the PF experiences an increase in pH owing to the removal
25 of carbon. The filtration can occur through adsorption, absorption, physical
trapping, and other more complex means.

A system used to effect this uptake is known as a *periphyton filter*; the periphyton comprising a culture of a family of fresh, brackish, and/or salt-water aquatic plants known as attached microalgae. Unlike such organisms as free-floating plankton, benthos or attached algae is stationary community of epiphytes
5 that will grow on a wide variety of surfaces. When occurring in the path of flowing water, the stationary algae remove nutrients and other compounds from the passing water, while absorbing CO₂ and releasing O₂ as a result of respiration and photosynthesis. Once a colony is established, roots or holdfasts cover the culture surface. If the plant bodies are harvested, leaving the roots behind, the
10 nutrients and other pollutants contained in the plant bodies are removed from the water, causing a natural filtration effect.

A further advantage to this technique is that the enriched algae can be harvested and used as fish or animal feed, which serves to return the nutrients to the food chain.

15 Periphyton filters (PF) have the potential for use in a variety of applications. For example, the turf can be used to replace biological or bacteriological filters in aquaria. As mentioned, natural periphyton can be used to remove nutrients and other contaminants from polluted waters. In addition, by harvesting the algal mass, various processes can be used to produce a biomass
20 energy source such as methane or ethanol, fertilizer, a human or animal food additive or supplement, cosmetics, or pharmaceuticals.

The high productivity of the algae in a fibrous form has also yielded uses in the paper and paper products industry, as the harvested algae are stronger and easier to process than wood fiber. This capability has resulted in a sustainable
25 method of managing human impact on aquatic ecosystems.

Periphyton filters behave differently in water with varying location, speciation, chemical characteristics, and other parameters. Experience *in situ* has in some cases resulted in weak or poor productivity owing to low concentrations of available nutrients. It has been shown that if a fraction of the primary nutrients
5 are not available, then the periphyton filters struggle to develop the critical mass necessary to invoke a substantial precipitation and physical trapping capability and' concurrent filtration characteristics. In particular, the presence of microinvertebrates and their eggs can compromise the success of a periphyton filtration system by consuming desirable periphyton and by eating the root or
10 holdfast of the algal filament.

Toxic cyanobacteria pose a particularly formidable set of filtration challenges in that the toxins are very persistent in the environment and can exist both inside and outside the algal cell. It is known to treat toxin-containing water with ozone because of its strong oxidizing effect when mixed in water; however,
15 the nutrients in ozonated water become available and are reconsumed by the toxic algae.

Studies in algal turf production are known in the art. Algal turf techniques have been disclosed in Adey's U.S. Patent No.4,333,263, and the present inventor's U.S. Patent Nos. 5,131,820, 5,527,456, 5,573,669, 5,591,341,
20 5,846,423, and 5,985,147, the disclosures of which are incorporated herein by reference.

SUMMARY OF THE INVENTION

It is therefore an object of the present invention to provide a system and method for pretreating and/or post-treating water in concert with a periphyton
25 filtration bed.

It is another object to provide such a system and method for reducing a population of undesirable microinvertebrates in a periphyton filtration bed.

It is an additional object to provide such a system and method for reducing or eliminating toxins from inflow water as well as a toxicity level of harvested
5 algal mass.

These objects and others are attained with the system and method of the present invention. The system comprises means for adding a strong oxidizer to the influent, and, in some cases, to the effluent. A particular embodiment comprises ozonating the water. The method of treating water comprises the steps
10 of exposing water desired to be treated to ozone in sufficient quantity to reduce a concentration of undesired microorganisms therein and flowing the water over a colony of attached algae to remove undesired matter therefrom, such as, but not intended to be limited to, nutrients.

The features that characterize the invention, both as to organization and
15 method of operation, together with further objects and advantages thereof, will be better understood from the following description used in conjunction with the accompanying drawing. It is to be expressly understood that the drawing is for the purpose of illustration and description and is not intended as a definition of the limits of the invention. These and other objects attained, and advantages
20 offered, by the present invention will become more fully apparent as the description that now follows is read in conjunction with the accompanying drawing.

BRIEF DESCRIPTION OF THE DRAWING

FIG. 1 is a schematic illustration of a first embodiment of the invention.

FIG. 2 is a schematic illustration of a second embodiment of the invention.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

A description of the preferred embodiments of the present invention will now be presented with reference to **FIGS. 1 and 2**.

It is known to use ozone to treat water because of the properties of the unstable O_3 molecule, which is a strong oxidizer. Ozone is typically generated, for example, by ultraviolet radiation or corona discharge. Since ozone is a gas, it must be dissolved or broken into small bubbles to optimize contact with the target microorganisms in the influent and, in some cases, the effluent. An optimal residence time should be achieved in the water to be treated to maximize particle contact. This may be achieved, for example, with a mixing chamber or a mixing pump.

If the location of the periphyton filter is at some distance from the water to be treated, mixing may occur, for example, downstream and generally adjacent a supply pump or pipe entrance, with a single or multiple static mixers agitating the water/ozone combination. The residence time is then equal to the travel time to the periphyton filter, which can be tested for sufficiency of contact time. In addition, further static mixers and ozone injection points may be positioned along the pathway to the periphyton filter to increase effectiveness and efficiency.

In an alternate embodiment a covered pond may be used, such a pond cover having an ozone destruct port at the highest location to catch ozone prior to escaping into the atmosphere. A subsurface ~ tank may be used to increase contact time, such a tank having a high-pressure ozone injection at its bottom for optimal dispersion of ozone into the water column.

The present invention provides the following benefits:

- Ozone breaks up planktonic algae, bacteria, and other organically bound particles in lake water, thereby making nutrients available for use and concurrent growth of the periphyton.

- After the nutrients are available and removed by the periphyton, the water can be returned to the water body from which it came, or to another water body, in a state that will limit the ability of toxic algae to regrow, thereby effecting remediation.

- Ozone destroys certain toxic compounds found in cyanobacteria (blue-green algae) recently found to be dangerous to humans and other animals. These toxic compounds, as well as nontoxic compounds, are then available to be taken up by filamentous algae grown for industrial use, such as in the paper products industry.

- Ozone destroys both microinvertebrates and their eggs, which often settle, hatch, and grow as they consume desirable periphyton, thus reducing the effectiveness of filtration.

Other devices to be used alone or in conjunction with ozone to enhance performance are plasma sparkers and ultraviolet light treatment systems, such as are known in the art.

Two embodiments of the present invention are illustrated schematically in **FIG. 1** and **2**. In the first embodiment (**FIG. 1**) of the system **10** water is shown being taken in from deep water **11**, shallow water **12**, or a tributary **13** by way of pipes **14** and pumps **15-17**, respectively. An ozone generator **18** provides ozone to an ozone injection apparatus **19** so that the water desired to be treated can be contacted with ozone in chamber **20**. Alternately, as mentioned above, a submersible plasma sparker may be used. Ozonated water is carried via transfer

5 piping **21** to a distribution manifold **22**, which distributes the water to the inlet end **23** of a periphyton bed **24**, which is tilted to permit the water to flow downward to the outlet end **25**. The treated water is then collected into a transfer pipe system **26**, and is then either returned to a waterway **27** or transferred to a drinking water treatment system **28** of ground water aquifers **29**.

10 In the second embodiment (**FIG. 2**) of the system **30**, inflowing water **31** is pumped into ozone distribution piping **32**, into which is also injected ozone from an ozone generator **33**. Prior to exposure to ozone, the water may be exposed to at least one of ultraviolet radiation and acoustic energy **43**. Following passage through an ozone injection diffuser **34**, the water proceeds via transfer piping **35** into multiple ozone contact chambers **36**. Three are shown here, but this is not intended as a limitation. When fully ozonated, the water exits via discharge piping **37**.

15 In either of the above-described embodiments, an additional step may be taken of adding a pesticide to the algal colony for controlling insects. The pesticide may be selected, for example, from a group consisting of an insecticide, a pyrethroid, or a natural pyrethrum, although these are not intended as limitations.

20 In a particular embodiment, the pesticide may comprise *bacillus therengensus israelioans* (BTI). A further element of either of the systems **10,30**, shown in **FIG. 1**, comprises a BTI culturing system **40**, wherein BTI is substantially continuously cultured, or cultured as needed, and a continuous drip of BTI is provided via line **41** leading to drip hose **42** adjacent the inlet **23** of the periphyton bed **24**.

25 As an additional or alternative embodiment, further systems and methods are envisioned for detoxifying one or more elements of the system **10,30**. As an

example (**FIG. 1**), the algal colony **24** may be harvested by means known in the art from its base **44**, and a pesticide **P** may be added to the harvested algae to form a mixture **24'**. This mixture **24'** is exposed to sunlight or other means to provide detoxification and then ground to form a mulch **24''**. Such a mulch may
5 then be used atop the base **44** to form a subsequent algal colony **24**. The pesticide may be selected from a group consisting of natural pyrethrum, natural pepper, garlic, elder, and lemon sage, although these are not intended as limitations.

Further, the algal colony **24** may be harvested by means known in the art, and **20** pesticide **P** may be added to the base **44** wherein water is not flowing, and allowed to detoxify the base **44**. Following sufficient time for detoxification, an agonist may be added, such as an alkaline solution, to detoxify the pesticide prior to restarting water flow over the algal colony **24**. In this case, the pesticide may comprise at least one of a synthetic pyrethroid or a natural pyrethrum.

It may be appreciated by one skilled in the art that additional embodiments
15 may be contemplated, including alternate methods of introducing ozone and the use of alternate oxidizing agents to the treatment water.

In the foregoing description, certain terms have been used for brevity, clarity, and understanding, but no unnecessary limitations are to be implied therefrom beyond the requirements of the prior art, because such words are used
20 for description purposes herein and are intended to be broadly construed. Moreover, the embodiments of the apparatus illustrated and described herein are by way of example, and the scope of the invention is not limited to the exact details of construction.

CLAIMS

What is claimed is:

- 1 1. A method of treating water comprising the steps of:
2 exposing water desired to be treated to ozone in sufficient quantity
3 to reduce a concentration of undesired microorganisms therein; and flowing the
4 water over a colony of attached algae to remove undesired matter therefrom.

- 1 2. The method recited in Claim 1, wherein the water-exposing step
2 comprises the steps of injecting ozone into at least one of a mixing chamber and
3 a body of water, pumping the water to be treated into the mixing chamber, and
4 mixing the water to be treated with the injected ozone.

- 1 3. The method recited in Claim 1, further comprising the step, prior to
2 the water exposing step, of generating ozone by at least one of exposing air to
3 ultraviolet radiation and creating a corona discharge.

- 1 4. The method recited in Claim 1, further comprising the step of
2 exposing the water to be treated to at least one of ultraviolet radiation and
3 acoustic energy.

- 1 5. The method recited in Claim 1, wherein the water-exposing step
2 comprises pumping the water into a bottom end of a tube, injecting ozone
3 adjacent the bottom end of the tube, and permitting the water and the ozone to
4 mix while rising toward a top end of the tube.

1 **6.** The method recited in Claim 1, further comprising the step of
2 treating the water with ozone following the water-flowing step.

1 **7.** The method recited in Claim 1, further comprising the step of
2 passing the water through an activated carbon filter following the water-flowing
3 step.

1 **8.** The method recited in Claim 1, further comprising the step of adding
2 a pesticide to the algal colony for controlling insects, the pesticide selected from
3 a group consisting of an insecticide, a pyrethroid, or a natural pyrethrum.

1 **9.** The method recited in Claim 8, further comprising the step of adding
2 a pesticide to the algal colony for controlling insects, the pesticide comprising
3 *bacillus therengensus isralloans*.

1 **10.** The method recited in Claim 9, further comprising the step of
2 culturing *bacillus therengensus isralloans*, and wherein the pesticide-adding step
3 comprises delivering a substantially continuous supply of *bacillus therengensus*
4 *isralloans* to an inlet of the algal colony.

1 **11.** The method recited in Claim 1, further comprising the steps of:
2 extracting the water to be treated from a body of water prior to the
3 exposing step; and
4 returning the treated water the to body of water following the water-
5 flowing step.

1 **12.** The method recited in Claim 1, wherein the ozone-exposing step
2 comprises covering a body of water and injecting ozone into the body of water.

1 **13.** The method recited in Claim 1, wherein the ozone-exposing step
2 comprises:

3 pumping water out of a body of water into a supply pipe;
4 injecting ozone into the supply pipe; and
5 directing the water to an inlet end of the algal colony.

1 **14.** The method recited in Claim 13, wherein the ozone-injecting step
2 comprises injecting ozone at a plurality of injection locations along the supply
3 pipe.

1 **15.** The method recited in Claim 1, further comprising the step,
2 following the water-flowing step, of repeating the ozone-exposing step and the
3 water-flowing step by recirculating the water emerging from the algal colony.

1 **16.** The method recited in Claim 1, further comprising the steps,
2 following the water-flowing step, of harvesting the algal colony, adding a
3 pesticide to the harvested algae, exposing the mixed algae and pesticide to
4 sunlight for achieving detoxification, and using the detoxified mixed algae and
5 pesticide to form a base for another algal colony.

1 **17.** The method recited in Claim 16, wherein the pesticide comprises one
2 or more pesticides selected from a group consisting of natural pyrethrum, natural
3 pepper, garlic, elder and lemon sage.

1 **18.** The method recited in Claim 1, wherein the colony is attached to a
2 base, and further comprising the steps, following the water-flowing step, of
3 harvesting the algal colony, adding a pesticide to the colony base, and detoxifying
4 the base.

1 **19.** The method recited in Claim 18, wherein the pesticide is selected
2 from a group consisting of a synthetic pyrethroid and a natural pyrethrum.

1 **20.** A system for treating water comprising:
2 means for exposing water desired to be treated to ozone in sufficient
3 quantity to reduce a concentration of undesired microorganisms therein and to
4 liberate available nutrients therefrom;
5 a colony of attached algae for removing undesired matter from the
6 ozone exposed water; and
7 means for directing the ozone-exposed water from the water-
8 exposing means to the algal colony.

1 **21.** The system recited in Claim 20, wherein the water-exposing means
2 comprises a mixing chamber, means for injecting ozone into the
3 mixing chamber, a pump for pumping the water to be treated into the mixing
4 chamber, and a mixer for mixing the water to be treated with the injected ozone.

1 **22.** The system recited in Claim 20, further comprising means for
2 generating ozone comprising at least one of means for exposing air to ultraviolet
3 radiation and means for creating a corona discharge.

1 **23.** The system recited in Claim **20**, further comprising means for
2 exposing the water to be treated to at least one of ultraviolet radiation and
3 acoustic energy.

1 **24.** The system recited in Claim **20**, further comprising:
2 a tube having a bottom end and a top end;
3 a pump for pumping the water into the tube bottom end and upward
4 toward the top end;
5 means for injecting ozone adjacent the tube bottom end of the tube,
6 for permitting the water and the ozone to mix while being pumped toward a top
7 end of the tube.

1 **25.** The system recited in Claim **20**, further comprising means for
2 treating the water with ozone downstream of the algal colony.

1 **26.** The system recited in Claim **20**, further comprising the step of
2 passing the water through an activated carbon filter following the water-flowing
3 step.

1 **27.** The system recited in Claim **20**, further comprising means for adding
2 a pesticide to the algal colony for controlling insects, the pesticide selected from
3 a group consisting of an insecticide, a pyrethroid, or a natural pyrethrum.

1 **28.** The system recited in Claim 20, further comprising means for adding
2 a pesticide to the algal colony for controlling insects, the pesticide comprising
3 *bacillus therengensis isralioans*.

1 **29.** The system recited in Claim 28, further comprising means of
2 culturing *bacillus therengensis isralloans*, and wherein the pesticide-adding
3 means comprises means for delivering a substantially continuous supply of
4 *bacillus therengensis isralloans* to an inlet of the algal colony.

1 **30.** The system recited in Claim 20, further comprising:
2 means for extracting the water to be treated from a body of water;
3 and means for returning the treated water the to body of water downstream of the
4 algal colony.

1 **31.** The system recited in Claim 20, wherein the ozone-exposing means
2 comprises a cover over a body of water and means for injecting
3 ozone into the body of water.

1 **32.** The system recited in Claim 20, wherein the ozone-exposing means
2 comprises:
3 a supply pipe having an inlet end and an outlet end;
4 a pump positioned to extract water out of a body of water into the
5 supply pipe to pump the extracted water to an inlet end of the algal colony; and
6 means for injecting ozone into the supply pipe.

1 **33.** The system recited in Claim **20**, further comprising means for
2 redirecting water from an outlet end of the algal colony to the ozone-exposing
3 means for recirculating the water emerging from the algal colony.

1 **34.** The system recited in Claim **20**, further comprising means for
2 harvesting the algal colony following exposure to water to be treated and means
3 for adding a pesticide to the harvested algae.

4 **35.** The system recited in Claim **34**, wherein the pesticide comprises one
5 or more pesticides selected from a group consisting of natural pyrethrum, natural
6 pepper, garlic, elder, and lemon sage.

1 **36.** The system recited in Claim **20**, further comprising a base to which
2 the algal colony is attached, and further comprising means for harvesting the algal
3 colony, means for adding a pesticide to the colony base, and means for
4 detoxifying the base.

1 **37.** The system recited in Claim **36**, wherein the pesticide is selected
2 from a group consisting of a synthetic pyrethroid and a natural pyrethrum.
