

ABSTRACT

DATA ACQUISITION PROGRAM, DATA ACQUISITION METHOD, AND DATA
ACQUISITION DEVICE

5 Provided are a data acquisition program, a data
acquisition method, and a data acquisition device that can
support the registration of a location of data to be
extracted from an HTML document. The data acquisition
program causes a computer (100) to execute a process (133)
of extracting first data and second data that are separated
10 from each other by a predetermined tag or symbol, from a
document written in HTML. The data acquisition program
also causes the computer to execute a process (134) of
displaying the extracted first data and the extracted
second data in an associated manner. The data acquisition
15 program also causes the computer to execute a process (135)
of specifying a position of a tag included in the document
on a hierarchical structure with respect to the first data
or the second data in the document, upon detecting that the
displayed first data or the displayed second data is
20 selected. The data acquisition program also causes the
computer to execute a process (135) of allowing
registration of the position on the hierarchical structure.
