

ABSTRACT

There is provided a medicine storage cassette which is capable of dispensing medicine sheets one by one even in cases where two medicine sheets are fitted together by mating their pocket-formed surfaces with each other. A dispensing section 2 of a medicine storage cassette 1 includes first limiter sections 21, disposed at two upper and lower portions. The first limiter section 21 has: a contact member 21a which makes contact with an edge of a forwardmost PTP sheet 100; a support section 21b which movably supports the contact member 21a so that the contact member 21a can ride over the edge of the PTP sheet 100; and a spring 21c which urges the contact member 21a in a direction to stop the PTP sheets 100. The dispensing section 2 also includes second limiter sections 22 disposed at two right-side and left-side portions.
