

Description

FRUIT JUICE BEVERAGE HAVING IMPROVED QUALITY OF TASTE
EXHIBITED BY SUGAR AND SWEETENER

Technical Field

[0001]

The present invention relates to a fruit juice beverage having a sugar and a sweetener with an improved taste quality, and a method for producing the fruit juice beverage.

Background Art

[0002]

Humans have five sensory systems, and the sense of taste is one of the sensory systems of humans. The taste receptor organ to receive tastes is called taste buds, which exist on the fungiform papillae existing over a wide area, mainly on the tip of the tongue, on the vallate papillae existing on a limited area of the back of the tongue, and on the foliate papillae. The taste buds are a cell assembly composed of elongate cells, called taste cells, and basal cells. The taste cells protrude microvilli toward the tongue surface, and form synapses at bottom of the cells with taste nerve fibers entering the taste buds. Tastes we usually sense are transmitted as taste information via the taste nerves to the brain, where the tastes are perceived. Known taste receptors of

sweetness include T1R2 and T1R3. T1R2 and T1R3 are reported to form hetero-dimers (Non-patent Literatures 1 to 3).

[0003]

Although various studies have been made on the sense of taste, little has been revealed yet in this field. We usually experience various tastes of foods. Foods that seem to be tasty have appropriately mixed and well-harmonized tastes. The taste of foods may be tasted as a single taste in some cases, but is often tasted as a mixed taste of various tastes, which are associated with one another.

[0004]

Meanwhile, foods have been required to have lower calories in addition to a good taste in recent years. This relates to a fact that lifestyle-related diseases such as obesity and diabetes are regarded as a problem.

However, to produce lower-calorie foods, their natural sugar concentration has to be maintained low. This is an obstruction in the case of providing foods that exhibit low calories and a good taste.

[0005]

As an example of a contrast effect, which is an interaction of tastes, there has been long known a phenomenon in which addition of salt to sweet red-bean soup enhances sweetness. There is an example that reports the interaction between saltiness and sweetness by

focusing on this phenomenon, and it is concluded that the interaction between sweetness and saltiness requires sweetness that is strong to a certain degree (a 15% solution) and a salt concentration that is high to a certain degree (0.1 to 0.2%) (Non Patent Literature 4).

[0006]

In addition, foods and drinks that exhibit sweetness by using a high-intensity sweetener of low calorie, such as Rebaudioside A, as a substitute for a natural sugar have also been developed, but the sweetness exhibited by a high-intensity sweetener has distinctive aftertaste, which hinders the provision of good taste.

Summary of Invention

[0008]

The development of a method for well improving the taste quality exhibited by a sugar and a sweetener while having an adequate sweetness intensity and maintaining the amount of the natural sugar used in a fruit juice beverage low has been much awaited.

Means for Solving the Problems

[0009]

The present inventors succeeded for the first time in enhancing a sweetness based on a combined use of a natural sugar and a specific high-intensity sweetener and improving a taste quality by containing not only the natural sugar but also the specific high-intensity sweetener and adding a low concentration of sodium and a low concentration of potassium and/or calcium. Description of Embodiments

[0012]

Hereinafter, the present invention will be described in detail. The following embodiments are examples to describe the present invention and do not intend to limit the present invention only to these embodiments. The present invention can be carried out in various embodiments without departing from the spirit of the present invention.

Note that all of the literatures, laid-open publications, patent publications, and other patent literatures cited herein are deemed to be incorporated by reference into the present specification.

In the present specification, for example, the phrase "the content of the A component is X mg/100ml" means that "X mg of the A component is contained in 100 ml of the beverage". In addition, for example, the phrase "the content of the B component is Y ppm" means that "the B component is contained in Y ppm with respect to the total amount (100 mass%) of the beverage".

[0013]

1. Fruit juice beverage having a natural sugar and a high-intensity sweetener with an improved taste quality

The present invention provides the following fruit juice beverage (hereinafter, referred to as "the fruit juice beverage of the present invention") as a first embodiment.

A fruit juice beverage comprising:

(a) a natural sugar in an amount corresponding to a sweetness intensity X1;

(b) a high-intensity sweetener in an amount corresponding to a sweetness intensity X2;

(c) less than 70 mg/100ml of sodium; and

(d) less than 70 mg/100ml of potassium and/or less than 70 mg/100ml of calcium,

wherein the high-intensity sweetener comprises at least one high-intensity sweetener b1 selected from the group consisting of rebaudioside M, rebaudioside D, rebaudioside N, rebaudioside O, rebaudioside E, a luohanguo extract, mogroside V, and thaumatin, and

$0.1 < (X1 + X2) \leq 20$ is satisfied.

The fruit juice beverage of the present invention has a sweetness of a sweetness intensity X3 exhibited by the components (a) to (d).

[0014]

In other words, in the fruit juice beverage of the present invention, the components having a sweetness are (a) a specific amount of a natural sugar and (b) a specific

amount of a predetermined high-intensity sweetener. The sweetness exhibited by the fruit juice beverage of the present invention should computationally be the total value of the sweetness intensity obtained when the component (a) is added to the fruit juice beverage and the sweetness intensity obtained when the component (b) is added to the fruit juice beverage. However, (c) sodium and (d) potassium and/or calcium are present in the fruit juice beverage although the concentrations thereof are low, and thus the sweetness exhibited by (a) the natural sugar and (b) the high-intensity sweetener is enhanced, and the fruit juice beverage of the present invention has a sweetness more than the simple sum of the sweetness intensities. The present invention means to possibly further include additional components such as an acidulant, a flavor, a vitamin, a color, an antioxidant, an emulsifier, a preservative, a seasoning, an extract, a pH adjuster, and a quality stabilizer in addition to these components (a) to (d). However, the fruit juice beverage of the present invention does not include a substance having a sweetness other than the components (a) and (b) as a sweetener.

[0015]

Further, in the fruit juice beverage according to a preferable embodiment of the present invention, improving effect on taste qualities is exhibited in addition to sweetness enhancement. For example, in the fruit juice

beverage according to an embodiment of the present invention, it is preferable for at least one of flavor (aroma) intensity and suppression of an odd taste (bitterness, astringency, or the like) to be improved. The effect of eliciting a flavor (aroma) can be confirmed not only by sensory evaluation but also by analysis of the amount of a volatilized aroma component by gas chromatography. In addition, in an embodiment of the present invention, by increasing the amount(s) of K and/or Ca added instead of Na, the flavor of a sparkling beverage can be improved while suppressing increase in saltiness.

[0016]

(Fruit juice)

5 to 30%, 10 to 30%, 15 to 30%, 20 to 30%, 1 to 25%, 5 to 25%, 10 to 25%, 15 to 25%, 1 to 20%, 5 to 20%, 10 to 20%, 1 to 15%, or 5 to 15%, depending on embodiments.

[0020]

In the present invention, the "fruit juice percentage" refers to a relative concentration with that of a straight fruit juice obtained by squeezing a fruit taken as 100% and can be converted based on a reference level of sugar refractometer index (°Bx) or a reference level of acidity (%) as defined in the JAS standard (Japanese agricultural standard for fruit beverages).

The values of the reference levels of sugar refractometer index of typical fruits (unit: °Bx) are orange: 11, mikan: 9, grapefruit: 9, pineapple: 11, cranberry: 7, blueberry and guava: 8, banana: 23, papaya: 9, passion fruit: 14, mango: 13, apple: 10, grape: 11, peach: 8, Japanese pear: 8, Western pear: 11, apricot: 7, sumomo: 6, and melon and kiwi fruit: 10.

The reference levels of acidity (unit: %) of typical fruits are lemon: 4.5, lime: 6, ume: 3.5, and kabosu: 3.5.

[0021]

Specifically, the fruit juice percentage can be calculated from the amount (g) of a fruit juice blended in 100 mL of a fruit juice beverage and the concentration rate of the fruit juice calculated from the reference level of sugar refractometer index (°Bx) or the reference level

of acidity (%) described above by the following conversion expression.

$$[\text{Fruit juice percentage (\%)}] = [\text{amount of fruit juice blended (g)}] \times [\text{concentration rate}] / 100 \text{ mL} \times 100$$

For example, the JAS standard for an orange fruit juice is Bx 11°, and thus when 6.0% by weight of a concentrated orange fruit juice having Bx 55° is blended in a beverage, the fruit juice percentage is 30%. When converting the fruit juice percentage of a fruit juice based on sugar refractometer index of the JAS standard, the sugar refractometer index of a sugar, honey, or the like added to the fruit juice shall be excluded.

[0022]

The form of the fruit juice beverage of the present invention is not limited, and the fruit juice beverage may be, for example, in a form of a beverage in which a concentrated fruit juice extract is dissolved or in a form of a packaged fruit juice beverage packed and sealed in a container, such as a can or a PET bottle.

[0023]

(Natural Sugar)

In the present invention, a "natural sugar", which is represented by the general formula of $C_m(H_2O)_n$, wherein m and n independently represent a natural number, contains a D-form carbohydrate, digestible by humans. Examples of the D-form carbohydrate include glucose, sucrose, fructose, maltose, oligosaccharides (for example,

fructooligosaccharide, maltooligosaccharide, isomaltooligosaccharide, and galactooligosaccharide), high-fructose corn syrup (isomerized sugars), lactose, psicose, allose, tagatose, and combinations thereof.

Examples of the combination of glucose, sucrose, fructose, maltose, oligosaccharides, high-fructose corn syrup, and lactose include the following. Specifically, the combination includes sucrose and high-fructose corn syrup, sucrose and glucose, sucrose and fructose, sucrose and maltose, sucrose and an oligosaccharide, sucrose and lactose, high-fructose corn syrup and an oligosaccharide, sucrose and psicose; sucrose, high-fructose corn syrup, and glucose; sucrose, high-fructose corn syrup, and fructose; sucrose, high-fructose corn syrup, and maltose; sucrose, high-fructose corn syrup, and an oligosaccharide; sucrose, high-fructose corn syrup, glucose, and an oligosaccharide; sucrose, glucose, fructose, and an oligosaccharides; and glucose, sucrose, fructose, maltose, an oligosaccharide, high-fructose corn syrup, lactose, and tagatose.

[0024]

Since a natural sugar has high energy, the energy (calorie) of the fruit juice beverage can be greatly reduced by decreasing the content of the natural sugar. The present invention keeps the concentration of the natural sugar low to decrease the energy (i.e., low calorie), but strong sweetness is felt when ingested by a

combination of a natural sugar, a high-intensity sweetener, and sodium. Accordingly, the amount of the natural sugar of a sweetness intensity X1 is preferably an amount of providing an energy of 50 Kcal/100 ml or less. The amount corresponding to the sweetness intensity X1 of the natural sugar refers to an amount (a concentration) that exhibits the sweetness of the sweetness intensity X1 under conditions where the natural sugar is dissolved in water at 20°C having a volume equivalent to that of the fruit juice beverage of the present invention.

[0027]

Here, the sweetness intensity means sweetness exhibited by a substance. For example, in the case where the sweetness intensity exhibited by sucrose per unit concentration Brix 1 is defined as a degree of sweetness of 1, glucose has a degree of sweetness of 0.6 to 0.7 (center value: 0.65). A numerical value obtained by

multiplying this degree of sweetness by the concentration Brix value of glucose is the sweetness intensity of glucose. Thus, when the concentration of glucose is Brix 1.5, the sweetness intensity of glucose is $0.65 \times 1.5 = 0.975$. When calculating the sweetness intensity in the present invention, the sweetness intensity of a sugar showing a range in the degree of sweetness, the center value is used unless otherwise noted.

(High-Intensity Sweetener)

In the present invention, the "high-intensity sweetener" refers to a compound having sweetness more intense than that of sucrose, and may be a naturally occurring compound, a synthetic compound, and a combination of a naturally occurring compound and a synthetic compound. The high-intensity sweetener, in an

amount equivalent to sucrose, exhibits sweetness 5 times or more, 10 times or more, 50 times or more, 100 times or more, 500 times or more, 1000 times or more, 5000 times or more, 10000 times or more, 50000 times or more, or 100000 times or more as that of sucrose. The high-intensity sweetener exhibits extremely intense sweetness in this way. When the existence of the natural sugar and high-intensity sweetener in the fruit juice beverage of the present invention is expressed in a weight ratio, "natural sugar:high-intensity sweetener" is 5:1 to 10:1, 50:1 to 100:1, 50:1 to 200:1, 500:1 to 1000:1, 5000:1 to 10000:1, and 50000:1 to 100000:1.

[0029]

In the present invention, as the high-intensity sweetener, at least one high-intensity sweetener b1 selected from the group consisting of rebaudioside M, rebaudioside D, rebaudioside N, rebaudioside O, rebaudioside E, a Luo han guo extract, mogroside V, and thaumatin is used.

The content of the high-intensity sweetener b1 based on the total amount (100 mass%) of the high-intensity sweetener as the component (b) is preferably 50 mass% or more, more preferably 60 mass% or more, further preferably 70 mass% or more, more further preferably 80 mass% or more, and particularly preferably 90 mass% or more. In an aspect of the present invention, the high-intensity sweetener as the component (b) may substantially consist of the high-

intensity sweetener b1. In the present specification, the phrase "substantially consist of the high-intensity sweetener b1" means that impurities, such as other steviol glycoside and mogroside, which are inevitably included in the process (e.g., purification of a stevia extract or a Luo han guo extract or biosynthesis) of preparing the high-intensity sweetener b1 may be included.

[0030]

Rebaudioside M, rebaudioside D, rebaudioside N, rebaudioside O, and rebaudioside E may be directly extracted from stevia or may be obtained by attaching glucose to a compound having another structure contained in a stevia extract.

[0031]

The Luo han guo extract as a sweetener is an extract of Luo han guo containing a sweet substance derived from Luo han guo, and has been approved as a food additive in various countries including Japan and is commercially available. Examples of the sweet substance derived from Luo han guo include mogroside V, mogroside IV, 11-oxo-mogroside V, and Siamenoside I.

[0032]

Mogroside V is one of the major mogrol glycosides contained in Luo han guo, and it has been reported that it has a good-quality sweetness property close to sucrose when compared with rebaudioside A. In addition, the degree of sweetness of mogroside V is about 300 times that of

sucrose (Murata Y. et al., Nippon Shokuhin Kagaku Kogaku Kaishi, Vol. 53, No. 10, 527 to 533, (2006)). Mogroside V can be obtained from a Luo han guo extract (e.g., an alcohol extract of Luo han guo) through purification by chromatography or the like. Alternatively, mogroside V may be obtained by attaching glucose to a compound having another structure contained in a Luo han guo extract.

[0033]

The Luo han guo extract preferably contains mogroside V and the ratio thereof is not limited and can be 10 wt% or more, 15 wt% or more, 20 wt% or more, 25 wt% or more, 30 wt% or more, 35 wt% or more, 40 wt% or more, 45 wt% or more, 50 wt% or more, 55 wt% or more, 60 wt% or more, 65 wt% or more, 70 wt% or more, and 75 wt% or more, of the total dry weight of a Luo han guo extract. The content of mogroside V can be determined by a known technique such as liquid chromatography. The Luo han guo extract can be obtained by extracting a fruit of Luo han guo (*Siraitia grosvenorii*) with a suitable solvent (for example, an aqueous solvent such as water, an alcohol solvent such as ethanol or methanol, a mixed solvent of an aqueous solvent and an alcohol solvent such as water-containing ethanol or water-containing methanol), and then optionally carrying out a treatment such as degreasing, purification, concentration, and drying.

[0034]

Mogroside V may be one having a high purity, for example, a purity of 80% or more, 85% or more, 90% or more, 91% or more, 92% or more, 93% or more, 94% or more, 95% or more, 96% or more, 97% or more, or 98% or more. In mogroside V obtained by purifying a Luo han guo extract, understandably, the amount of Luo han guo extract components other than mogroside V is decreased with an increase in purity.

[0035]

Thaumatococcus is a protein-based sweetener extracted from a plant.

[0036]

In the present invention, an optional high-intensity sweetener b2 may be used in combination with the above-described high-intensity sweetener b1, as needed. Specific examples of the optional high-intensity sweetener b2 include peptide-based sweeteners, such as aspartame, neotame, and alitame; sucrose derivatives, such as sucralose; synthetic sweeteners, such as acesulfame K, saccharine, advantame, cyclamate, and dulcin; protein-based sweeteners extracted from plants, such as monellin, curculin, and brazzein, other than thaumatococcus; high-intensity sweeteners other than protein-based sweetener extracted from plants; tourmaline; and neohesperidin dihydrochalcone.

[0037]

The sucrose derivative is that obtained by substituting the OH group or the H group of sucrose with another substituent, and examples thereof include halogen derivatives of sucrose (sucralose), oxathiazinonedioxide derivatives, sugar alcohols, aldonic acid, and uronic acid.
[0038]

Examples of the high-intensity sweetener other than the protein-based sweeteners extracted from plants include sweeteners present in a stevia extract, other than rebaudioside M, rebaudioside D, rebaudioside N, rebaudioside O, and rebaudioside E; sweeteners present in a Luo han guo extract, other than mogroside V; sweeteners present in a Glycyrrhiza extract; and glycosides thereof, and also include monatin and glycyrrhizin.
[0039]

Examples of the sweetener present in a stevia extract, other than rebaudioside M, rebaudioside D, rebaudioside N, rebaudioside O, and rebaudioside E and the glycoside thereof include steviol, stevioside, rebaudioside A, rebaudioside B, and rebaudioside C.
[0040]

Examples of the sweetener present in a Luo han guo extract, other than mogroside V and the glycoside thereof include mogroside IV.
[0041]

The Glycyrrhiza extract refers to that obtained from roots or rhizomes of Glycyrrhiza uralensis Fisher,

Glycyrrhiza inflata Batalin, or Glycyrrhiza glabra Linne and having glycyrrhizic acid as a main component. Examples of the Glycyrrhiza extract include a Glycyrrhiza extract, glycyrrhizin, and a licorice extract.

[0042]

In the present invention, the high-intensity sweetener b1 is suitable at least one selected from the group consisting of rebaudioside M, rebaudioside D, a Luo han guo extract, mogroside V, and a combination thereof. In particular, rebaudioside D, rebaudioside M, or a mixture of rebaudioside D and rebaudioside M is suitable as the high-intensity sweetener b1.

[0043]

Rebaudioside D and rebaudioside M have less negative flavor, such as astringent taste and metallic taste, which is observed in rebaudioside A and have characteristics, such as good-quality sweetness, and they are expected to be used in the fields of food and drink (NIPPON KAGAKU KAISHI, (5), (1981), 726-735, "Sweet Diterpene-Glycoside of Leaves of Stevia rebaudiana Bertoni Synthesis and Structure-Sweetness Relationship of Rebaudiosides-A, -D, -E and Their Related glycosides", Kasai, Kaneda, Tanaka, Yamasaki, Sakamoto, Morimoto, Okada, Kitahata, and Furukawa). Thus, rebaudioside D and rebaudioside M when used alone are excellent in that they have less odd taste compared to rebaudioside A and sweetness close to sucrose.

Rebaudioside D and rebaudioside M each have sweetness about 200 times that of sucrose.

[0044]

Examples of the combination of the high-intensity sweeteners b1 and the combination of the high-intensity sweetener b1 and the optional high-intensity sweetener b2 include the followings. Specifically, the examples include combinations of rebaudioside D and rebaudioside M; rebaudioside D and rebaudioside A; rebaudioside M and rebaudioside A; rebaudioside M and mogroside V; rebaudioside D and mogroside V; rebaudioside D and advantame; rebaudioside D and acesulfame K; rebaudioside D and sucralose; rebaudioside M, rebaudioside D, and rebaudioside A; rebaudioside M, rebaudioside D, and mogroside V; rebaudioside M, rebaudioside D, and advantame; rebaudioside M, rebaudioside D, and acesulfame K; rebaudioside M, rebaudioside D, and sucralose; rebaudioside A, rebaudioside M, rebaudioside D, and mogroside V; rebaudioside A, rebaudioside M, mogroside V, and sucralose; rebaudioside D, rebaudioside M, mogroside V, and acesulfame K; rebaudioside M, rebaudioside A, mogroside V, and neohesperidin dihydrochalcone; and rebaudioside M, rebaudioside D, sucralose, neohesperidin dihydrochalcone, and brazzein.

[0045]

In addition, the examples include combinations of rebaudioside D and mogroside V; rebaudioside D and a Luo

han guo extract; rebaudioside M and a Luo han guo extract;
rebaudioside M, rebaudioside D, and a Luo han guo extract;
rebaudioside A, rebaudioside M, rebaudioside D, and a Luo
han guo extract; rebaudioside A, rebaudioside M, a Luo han
guo extract, and sucralose; rebaudioside D, rebaudioside
M, a Luo han guo extract, and acesulfame K; and

The amount corresponding to a sweetness intensity X2 of a high-intensity sweetener refers to an amount which provides sweetness of a sweetness intensity X2 under the conditions when the high-intensity sweetener is dissolved in water having the same volume as the fruit juice beverage of the present invention at 20°C.

[0048]

As in a natural sugar, also here, the sweetness intensity means the sweetness exhibited by a substance. For example, when the sweetness intensity exhibited by sucrose per unit concentration Brix 1 is defined as a degree of sweetness of 1, the degree of sweetness of rebaudioside D is 200 to 250 (center value 225), the degree of sweetness of rebaudioside M is 200 to 260 (center value 230), the degree of sweetness of rebaudioside N is 200 to 250 (center value 225), the degree of sweetness of rebaudioside O is 200 to 250 (center value 225), the degree of sweetness of rebaudioside E is 70 to 80 (center value

75), the degree of sweetness of a Luo han guo extract is 110 to 150 (center value 130), the degree of sweetness of mogroside V is 240 to 300 (center value 270), and the degree of sweetness of thaumatin is 2,000. The numerical value obtained by multiplying these degrees of sweetness by the concentration (w/v% (considered to be the same as w/w% in the case of a beverage)) of the high-intensity sweetener in the fruit juice beverage is the sweetness intensity of the high-intensity sweetener. When calculating the sweetness intensity in the present invention, the sweetness intensity of a high-intensity sweetener showing a range in the degree of sweetness, the center value is used unless otherwise noted.

[0049]

Further, the amount of a high-intensity sweetener can be P2 ppm and P2 ppm herein refers to an amount corresponding to a sweetness intensity X2. The fruit juice beverage of the present invention has an enhanced sweetness as having been already mentioned. Whether or not the sweetness of the fruit juice beverage of the present invention is enhanced can be evaluated by panelists who received sensory trainings. Further, for the sweetness intensity X3 of the fruit juice beverage of the present invention, standard fruit juice beverages to be the sweetness standards are prepared with sucrose concentrations assigned as sweetness intensities 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 15 and panelists compare the sweetness of the fruit juice beverage of the present invention with the sweetnesses of these standard fruit juice beverages thereby to measure the sweetness of the fruit juice beverage of the present invention. Note that the standard fruit juice beverages having a sweetness intensity of 1, 2, ... 15 are prepared by adding sucrose in such a way that a sucrose content is 1 g/100 g, 2 g/100

g, ... 15 g/100 g to the fruit juice beverage to which sucrose is not added.

Furthermore, of the standard fruit juice beverages having a lower sweetness than the fruit juice beverage of the present invention in the above measurement, the standard fruit juice beverage having the closest sweetness to that of the fruit juice beverage of the present invention is selected and adjusted in such a way as to have the same sweetness as that of the fruit juice beverage of the present invention by adding sucrose to the selected standard fruit juice beverage, during which a sweetness intensity X3 of the fruit juice beverage of the present invention can also be measured from a sucrose content in the adjusted standard fruit juice beverage.

Other examples of the method for measuring a sweetness of the fruit juice beverage of the present invention include a sweetness intensity rating using Visual Analogue Scale (VAS method). For the VAS method, literatures in The journal of Japanese Society of Stomatognathic Function (2014) 20 pp. 115-129 ("Construction of a Screening Test for Gustatory Function in Four Basic Tastes" by Toyota et al.) and the like can be referred. Specifically, in the measurement of sweetness intensity by the VAS method, for example, evaluators define sweetness intensities as "not sweet at all" at the lower end and "nothing is sweeter than this" at the upper end and, using a piece of paper on

which a vertical line indicating the intensities of sweetness on the straight line, assess a sweetness intensity sensed at that time by showing a position on the straight line.

In addition, in the present invention, the sweetness intensity X1 of the natural sugar, the sweetness intensity X2 of the high-intensity sweetener, the sodium content, the potassium and/or calcium content, the sweetness intensity X3 exhibited by the fruit juice beverage, and the energy of the fruit juice beverage are not limited to combinations of the numerical values exemplified above,

and any of the numerical values of the sweetness intensity X1, the sweetness intensity X2, the sodium content, the potassium and/or calcium content, the sweetness intensity X3, and the energy described herein can also be combined in a range that satisfies $0.1 < (X1 + X2) \leq 20$.

[0078]

Into the fruit juice beverage of the present invention, an acidulant (phosphoric acid, or the like), a flavor (an ester, or the like), a vitamin, a color, an antioxidant (sodium erythorbate, or the like), and an emulsifier (sucrose fatty acid ester, sorbitan fatty acid ester, polyglycerin fatty acid ester, or the like), a preservative, a seasoning, an extract, a pH adjuster, a quality stabilizer, or the like can further be appropriately blended as long as the effects of the present invention are not impaired.

[0079]

In a specific embodiment, the present invention provides the following fruit juice beverage (hereinafter, referred to as "fruit juice beverage A of the present invention").

A fruit juice beverage comprising:

(a) a natural sugar in an amount corresponding to a sweetness intensity X1;

(b) a high-intensity sweetener selected from the group consisting of rebaudioside M, rebaudioside D, and a

combination thereof in an amount corresponding to a sweetness intensity X2;

(c) 5 to 50 mg/100ml of sodium; and

(d) 0.5 to 50 mg/100ml of potassium and/or 0.5 to 50 mg/100ml of calcium,

wherein the fruit juice beverage has a sweetness of a sweetness intensity X3 exhibited by the components (a) to (d), and $0.1 < (X1 + X2) \leq 20$ is satisfied.

[0080]

In fruit juice beverage A of the present invention, the preferable ranges of the sweetness intensity X1, the sweetness intensity X2, the sodium content, the potassium and/or calcium content, the sweetness intensity X3, the high-intensity sweetener concentration P2, and the energy are, for example, as follows. These numerical values can be arbitrarily combined in a range that satisfies $0.1 < (X1 + X2) \leq 20$.

The natural sugar (including an example of a combination of glucose, sucrose, fructose, maltose, an oligosaccharide, a high-fructose corn syrup, and lactose) and the forms of sodium, potassium, and calcium in fruit juice beverage A of the present invention are defined as described in the section of the fruit juice of the present invention.

[0090]

In another specific embodiment, the present invention provides the following fruit juice beverage (hereinafter, referred to as "fruit juice beverage B of the present invention").

A fruit juice beverage comprising:

(a) a natural sugar in an amount corresponding to a sweetness intensity X1;

(b) a luo han guo extract in an amount corresponding to a sweetness intensity X2;

(c) 5 to 50 mg/100ml of sodium; and

(d) 0.5 to 50 mg/100ml of potassium and/or 0.5 to 50 mg/100ml of calcium,

wherein the fruit juice beverage has a sweetness of a sweetness intensity X3 exhibited by the components (a) to (d), and $0.1 < (X1 + X2) \leq 20$ is satisfied.

[0091]

In fruit juice beverage B of the present invention, the preferable ranges of the sweetness intensity X1, the sweetness intensity X2, the sodium content, the potassium and/or calcium content, the sweetness intensity X3, the luo han guo extract content P2, and the energy are, for example, as follows. These numerical values can be arbitrarily combined in a range that satisfies $0.1 < (X1 + X2) \leq 20$.

In addition, the natural sugar (including an example of a combination of glucose, sucrose, fructose, maltose, an oligosaccharide, a high-fructose corn syrup, and lactose) and the forms of sodium, potassium, and calcium in fruit juice beverage B of the present invention are defined as described in the section of the fruit juice beverage of the present invention.

[0101]

In another specific embodiment, the present invention provides the following fruit juice beverage (hereinafter, referred to as "fruit juice beverage C of the present invention").

A fruit juice beverage comprising:

(a) a natural sugar in an amount corresponding to a sweetness intensity X1;

(b) mogroside V in an amount corresponding to a sweetness intensity X2;

(c) 5 to 50 mg/100ml of sodium; and

(d) 0.5 to 50 mg/100ml of potassium and/or 0.5 to 50 mg/100ml of calcium,

wherein the fruit juice beverage has a sweetness of a sweetness intensity X3 exhibited by the components (a) to (d), and $0.1 < (X1 + X2) \leq 20$ is satisfied.

[0102]

In fruit juice beverage C of the present invention, the preferable ranges of the sweetness intensity X1, the sweetness intensity X2, the sodium content, the potassium and/or calcium content, the sweetness intensity X3, the mogroside V content P2, and the energy are, for example, as follows. These numerical values can be arbitrarily combined in a range that satisfies $0.1 < (X1 + X2) \leq 20$.

2. Method for producing a fruit juice beverage

Even for a fruit juice beverage having an energy (Kcal/100 ml) controlled to be low by setting the amounts of the natural sugar and the high-intensity sweetener blended each to a low level, the sweetness based on the natural sugar and the high-intensity sweetener can be enhanced by adding low concentration(s) of potassium and/or calcium in addition to sodium in a concentration so low as to not be detectable by the human.

Therefore, the present invention provides, as yet another embodiment, the following method for producing a fruit juice beverage with an enhanced sweetness (hereinafter, referred to as "the method of the present invention").

A method for producing a fruit juice beverage, comprising: to a raw material,

(i) adding (a) a natural sugar in an amount corresponding to a sweetness intensity X_1 and (b) a high-intensity sweetener in an amount corresponding to a sweetness intensity X_2 ;

(ii) adding (c) sodium such that a sodium concentration in the beverage is less than 70 mg/100ml; and

(iii) adding (d) potassium such that a potassium content in the beverage is less than 70 mg/100ml and/or adding (d) calcium such that a calcium content in the beverage is less than 70 mg/100ml,

wherein

the high-intensity sweetener comprises at least one high-intensity sweetener b_1 selected from the group consisting of rebaudioside M, rebaudioside D, rebaudioside N, rebaudioside O, rebaudioside E, a Luo Han Guo extract, mogroside V, and thaumatin,

the fruit juice beverage has a sweetness of a sweetness intensity X_3 exhibited by the components (a) to (d), and $0.1 < (X_1 + X_2) \leq 20$ is satisfied.

[0114]

The fruit juice beverage produced by the method of the present invention is the fruit juice beverage of the present invention described in the above section "1. Fruit juice beverage having a natural sugar and a high-intensity sweetener with an improved taste quality." In addition, the "raw material" in the method of the present invention

can be each material needed to produce a fruit juice beverage or a mixture thereof, and further, can include an additional component such as a preservative, a flavor, a carrier, or a milk component. In addition, the "raw material" can be composed of a plurality of materials. However, regardless of the type of the raw material, the fruit juice beverage of the present invention finally produced does not include a material having a sweetness other than components (a) and (b) as a sweetener.

[0115]

In the method of the present invention, any of the following Steps (i) to (iii) can be carried out first.

(i) Adding (a) a natural sugar in an amount corresponding to a sweetness intensity X1 and (b) a high-intensity sweetener in an amount corresponding to a sweetness intensity X2

(ii) Adding (c) sodium such that a sodium concentration in the beverage is less than 70 mg/100ml

(iii) Adding (d) potassium such that a potassium content in the beverage is less than 70 mg/100ml and/or adding (d) calcium such that a calcium content in the beverage is less than 70 mg/100ml

[0116]

In Step (i), (a) a natural sugar in an amount corresponding to a sweetness intensity X1 and (b) a high-intensity sweetener in an amount corresponding to a sweetness intensity X2 are added to a raw material, but

(a) a natural sugar in an amount corresponding to a sweetness intensity X1 and (b) a high-intensity sweetener in an amount corresponding to sweetness intensity X2 can be added separately.

Further, even when (a) a natural sugar in an amount of corresponding to a sweetness intensity X1 is added, the natural sugar in an amount corresponding to a sweetness intensity X1 does not need to be added at once but can be added in several divided batches. Similarly, even when (b) a high-intensity sweetener in an amount corresponding to sweetness intensity X2 is added, the high-intensity sweetener in an amount corresponding to sweetness intensity X2 does not need to be added at once but can be added in several divided batches.

In addition, as another embodiment, a mixture of the natural sugar and the high-intensity sweetener can also be added in several divided batches to make an adjustment such that the amount of the natural sugar and the amount of the high-intensity sweetener contained in the fruit juice beverage finally produced are the amount corresponding to the sweetness intensity X1 and the amount corresponding to the sweetness intensity X2, respectively.
[0117]

Even when adding (c) sodium such that a sodium concentration in the beverage is less than 70 mg/100ml in Step (ii), sodium does not need to be added at once, and sodium can be added in several divided batches.

The sodium added to the raw material in Step (ii) can be, for example, in the form of at least one selected from the group consisting of sodium chloride, sodium chloride, sodium malate, sodium sulfate, sodium citrate, sodium phosphate, sodium carbonate, sodium disulfide, sodium bicarbonate, sodium alginate, sodium arginate, sodium glucoheptonate, sodium gluconate, monosodium glutamate, sodium tartrate, monosodium aspartate, sodium lactate, sodium caseinate, sodium ascorbate, and mixtures thereof.

In addition, when sodium is contained in the fruit juice used, the total content of sodium derived from the fruit juice and additional sodium is adjusted to less than 70 mg/100ml.

[0118]

The sodium that can be added to the raw material in Step (iii) can be, for example, in the form of at least one selected from the group consisting of potassium alginate, potassium chloride, potassium citrate, potassium gluconate, monopotassium L-glutamate, potassium bromate, potassium hydrogen DL-tartrate, potassium hydrogen L-tartrate, potassium nitrate, potassium hydroxide, potassium sorbate, potassium carbonate, potassium lactate, potassium norbixin, potassium pyrosulfite, tetrapotassium pyrophosphate, potassium ferrocyanide, potassium polyphosphate, potassium metaphosphate, potassium aluminum sulfate, potassium sulfate, tripotassium phosphate,

dipotassium hydrogen phosphate, potassium dihydrogen phosphate, and mixtures thereof.

In addition, when potassium is contained in the fruit juice used, the total content of potassium derived from the fruit juice and additional potassium is adjusted to less than 70 mg/100ml.

[0119]

The calcium that can be added to the raw material in Step (iii) can be, for example, in the form of at least one selected from the group consisting of calcium L-ascorbate, calcium alginate, calcium disodium ethylenediaminetetraacetate, calcium chloride, carboxymethylcellulose calcium, calcium citrate, calcium glycerophosphate, calcium gluconate, monocalcium Di-L-glutamate, calcium silicate, calcium acetate, calcium oxide, calcium hydroxide, calcium stearate, calcium stearyl lactate, calcium sorbate, calcium carbonate, calcium lactate, calcium pantothenate, calcium dihydrogen pyrophosphate, calcium ferrocyanide, calcium propionate, calcium 5'-ribonucleotide, calcium sulfate, tricalcium phosphate, calcium monohydrogen phosphate, calcium dihydrogen phosphate, and mixtures thereof.

In addition, when calcium is contained in the fruit juice or water (particularly hard water) used, the total content of calcium derived from the fruit juice and water and additional calcium is adjusted to less than 70 mg/100ml.

[0120]

The "addition" herein means not only the actual operation of any of the components (a) to (d) to the raw material, but also the operation of adjusting the amounts of the components (a) to (d) in the fruit juice beverage finally produced through the production process of the fruit juice beverage of the present invention to the amount corresponding to the sweetness intensity X1, the amount corresponding to the sweetness intensity X2, less than 70 mg/100ml of sodium, and (d) less than 70 mg/100ml of potassium and/or less than 70 mg/100ml of calcium, respectively.

For example, if a first raw material contains a milk component, a grain, a bean, or an extract thereof, and accordingly this the raw material contains any one or more of the components (a) to (d) in advance, a second raw material for being mixed with the first raw material also contains the components (a) to (d), and the fruit juice beverage of the present invention can be produced by mixing the first and second raw materials, then there is no operation of individually adding the components (a) to (d) to the raw materials, but in the method of the present invention, Steps (i) to (iii) are considered to have been carried out as long as the fruit juice beverage of the present invention finally produced contains (a) a natural sugar in an amount corresponding to a sweetness intensity X1, (b) a high-intensity sweetener in an amount corresponding to a sweetness intensity X2, (c) less than

70 mg/100ml of sodium, and (d) less than 70 mg/100ml of potassium and/or less than 70 mg/100ml of calcium.

[0121]

When the fruit juice beverage of the present invention is made into a packed-in-container beverage, the method for producing a beverage according to the present invention includes filling the container with the fruit juice beverage. In addition, when the fruit juice beverage of the present invention is made into a packed-in-container beverage, sterilization of the fruit juice beverage before or after filling the container with the fruit juice beverage is preferable because the sterilization allows long-term storage of the packed-in-container beverage. For example, when the fruit juice beverage of the present invention is made into a canned fruit juice beverage, a can can be filled with a predetermined amount of the fruit juice beverage and subjected to retort sterilization, for example, at 120 to 125°C for about 5 to 20 minutes to perform heat sterilization. In addition, when the fruit juice beverage of the present invention is made into a PET bottled, paper packed, or bottled beverage, the fruit juice beverage can be subjected to UHT sterilization involving holding, for example, at 130 to 145°C for about 2 to 120 seconds or the like and a predetermined amount thereof can be subjected to hot packing or aseptic packaging at a low temperature to obtain a packed-in-container beverage.

4. Method for enhancing the sweetness of the fruit juice beverage

The present invention provides, as another embodiment, a method for enhancing the sweetness of the fruit juice beverage (hereinafter, referred to as "the sweetness enhancement method of the present invention"). (d) less than 70 mg/100ml of potassium and/or less than 70 mg/100ml of calcium in a fruit juice beverage.

[0141]

According to the sweetness enhancement method of the present invention, the sweetness of the fruit juice beverage is enhanced and a fruit juice beverage having a sweetness more than the sweetness intensity obtained when the component (a) is added to the fruit juice beverage and the sweetness intensity obtained when the component (b) is

added to the fruit juice beverage can be provided. In the sweetness enhancement method of the present invention, the "fruit juice beverage", "natural sugar", "sweetness intensity X1", "high-intensity sweetener", "sweetness intensity X2", sodium content, potassium and/or calcium content, forms of sodium and potassium and/or calcium in the fruit juice beverage, "sweetness intensity X3", and energy are defined as described in the above section for the fruit juice beverage, and the numerical values described in the above section for the fruit juice beverage are applicable to numerical values thereof as they are. In addition, examples of the "combination of glucose, sucrose, fructose, maltose, an oligosaccharide, a high-fructose corn syrup, and lactose" and the "combination of high-intensity sweeteners" are also the same as the examples described in the above section for the fruit juice beverage.

[0142]

As used herein, the term "at least" means that the number of a specific item can be greater than or equal to the number expressed. In addition, in the present application, the term "about" means that a subject matter is in ranges of $\pm 25\%$, $\pm 10\%$, $\pm 5\%$, $\pm 3\%$, $\pm 2\%$, or $\pm 1\%$, of the numerical value following the "about." For example, "about 10" means a range from 7.5 to 12.5.

Examples

[0143]

Hereinafter, the present invention will be specifically described with reference to Examples but the present invention is not limited to the following Examples.

In the Examples shown below, the sodium and potassium content in the base beverage before the addition of various additives was measured by atomic absorption spectroscopy using SpectrAA240FS (manufactured by Agilent Technologies, Inc.), and the calcium content was measured by ICP emission spectrometry using 5100VDV (manufactured by Agilent Technologies, Inc.) and ICPE-9000 (manufactured by Shimadzu Corporation). In addition, the sodium, potassium, and calcium content of a beverage sample after blending various additives was obtained by adding the sodium, potassium, and calcium content in the various additives calculated from the amounts blended to the sodium, potassium, and calcium content, respectively, in the base beverage measured by the above method.

[Example 1] Evaluation of the improving effect of sodium, potassium, and calcium on taste qualities

Experimental method

Natural sugars {sucrose (manufactured by Pacific Sugar Mfg. Co., Ltd.) and glucose (manufactured by Showa Sangyo Co., Ltd.)}, rebaudioside D (RebD) (purity 95% or more), sodium gluconate, potassium chloride, and calcium chloride were dissolved in an orange diluted fruit juice (fruit juice percentage: 10%, amount of sodium, amount of

potassium, and amount of calcium: 0 (mg/100ml), energy: 4 (kcal/100 ml), and Brix = 1.0) in the ratios shown in Table 2 below to prepare beverage samples. In addition, a solution to which none of sodium gluconate, potassium chloride, and calcium chloride was added was used as sample 1.

Brix in Table 2 was calculated from the concentrations of the natural sugars and the Brix derived from the orange diluted fruit juice, the amount of sodium was calculated from the sodium gluconate concentration, the amount of potassium was calculated from the potassium chloride concentration, and the amount of calcium was calculated from the calcium chloride concentration. In addition, the energy (kcal/100 ml) was calculated with the energy of RebD and the sodium, potassium, and calcium-derived components being 0 (kcal/100 ml).

As shown in Table 2, sample 1-1 has an amount of Na added of 20 mg/100ml, sample 1-2 has a total amount of Na + K added of 20 mg/100ml, and sample 1-3 has a total amount of Na + Ca added of 20 mg/100ml.

[0145]

The improving effect of sodium, potassium, and calcium on taste qualities was verified by the sensory comparison of the taste qualities of these beverage samples. The taste qualities that were the sensory evaluation items were "intensity of sweetness", "intensity of flavor (aroma)", "intensity of odd taste (bitterness, astringency, or the like)", and "intensity of saltiness", and those who received sensory trainings (4 persons) carried out verification as panelists.

First, each panelist calculated a "sensory evaluation score" for each taste quality for each beverage sample based on the common taste quality criteria established through daily training.

The "sensory evaluation score" is a numerical value of the difference in taste quality from sample 1 in the range of -3.0 to +3.0, with the degree of taste quality of sample 1 being "0" (reference). The criterion for each item of the "sensory evaluation score" is as follows.

(Sensory evaluation score)

- "+3.0": The target taste quality feels very strong compared to sample 1.
- "+2.0": The target taste quality feels strong compared to sample 1.
- "+1.0": The target taste quality feels slightly strong compared to sample 1.
- "0": The target taste quality is the same as that of sample 1.
- "-1.0": The target taste quality feels slightly weak compared to sample 1.
- "-2.0": The target taste quality feels weak compared to sample 1.
- "-3.0": The target taste quality feels very weak compared to sample 1.

In light of the above criteria, for example, when it was determined that the taste quality was between "+1.0" and "+2.0", it scored "+1.5" and the scores were given in 0.5 increments.

[0146]

Then, the "sensory evaluation score" calculated by each panelist was converted to the "conversion score" according to the following criteria, and the total conversion score of the four panelists for each taste was calculated.

(Conversion score)

- Conversion score "3": The sensory evaluation score is +1.5 or more.

- Conversion score "2": The sensory evaluation score is +1.0 or more and less than +1.5.
- Conversion score "1": The sensory evaluation score is +0.5 or more and less than +1.0.
- Conversion score "0": The sensory evaluation score is more than -0.5 and less than +0.5.
- Conversion score "-1": The sensory evaluation score is more than -1.0 and -0.5 or less.
- Conversion score "-2": The sensory evaluation score is more than -1.5 and -1.0 or less.
- Conversion score "-3": The sensory evaluation score is -1.5 or less.

For "intensity of sweetness" and "intensity of flavor", a larger total conversion score is more preferable, and for "intensity of odd taste" and "intensity of saltiness", a smaller total conversion score is more preferable.

[0147]

Table 3 shows the calculated results of the total conversion scores of each taste quality.
