(54) Title: FRAME FOR UNMANNED GROUND VEHICLE OR UGV

Fig. 1

(57) Abstract: The frame (2) comprises a pair of self-propelled lateral modules (3), which extend in a longitudinal direction, can be mutually coupled in a transverse direction and in a removable manner, and are adapted to contribute to create, when assembled, a support structure for a central module (5), which can be coupled in a removable manner to the frame (2) and is provided with a control system, which is configured to control the movements and the actuation of the self-propelled lateral modules (3). Each one of the self-propelled lateral modules (3) comprises a pair of bearing portions (10), and a connection portion (12), which mutually constrains the bearing portions (10) and is able to permit a relative movement thereof between an extended configuration, in which the bearing portions (10) define a greater longitudinal extension of the self-propelled lateral module (3), and a compact configuration, in which the bearing portions (10) define a smaller longitudinal extension of the self-propelled lateral module (3).
