Delivery package 2 to which delivery form 1 is attached is delivered to the destination of delivery package 2 according to delivery information 18a, 18b printed or written in information indication regions 14a, 14b.

[0030]

Then, when delivery package 2 is delivered to the destination, a receipt stamp is stamped on stamp region 15 in delivery slip 11, and then delivery slip 11 is separated from delivery form 1.

[0031]

The region of upper base material 10 that forms delivery slip 11 is attached to lower base material 20 by adhesive layer 40, but can be peeled off from lower base material 20 and separated from delivery form 1 because release layer 50 is laminated on the attachment surface of the region. As shown in Figure 2a, the region of upper base material 10 that forms delivery slip 11 is peeled from peeling start end 19a.

[0032]

When the region of upper base material 10 that forms delivery slip 11 is peeled from peeling start end 19a, as shown in Figure 2b, notification information 21a that is included in print layer 21 that is laminated on lower base material 20 becomes visible. Then, the peeled region reaches peeling finish end 10b, and the region of upper base material 10 that forms delivery slip 11 is completely peeled off from lower base material 20 and carried back by the carrier.

[0033]

Now, the operation of delivery form 1 described above will be described.

[0034]

[0050]

The region of upper base material 110 that forms delivery slip 111 is attached to lower base material 120 by adhesive layer 140, but can be peeled off from lower base material 120 and separated from delivery form 101 because release layer 150 is laminated on the attachment surface of the region. As shown in Figure 5a, the region of upper base material 110 that forms delivery slip 111 is peeled from peeling start end 119a.

[0051]

When the region of upper base material 110 that forms delivery slip 111 is peeled from peeling start end 119a, as shown in Figure 5b, notification information 121a that is included in print layer 121 that is laminated on lower base material 120 becomes visible. Then, the peeled region reaches the peeling finish end 110b, and the region of upper base material 110 that forms delivery slip 111 is completely peeled from lower base material 120 and carried back by the carrier.

[0052]

Now, an operation of delivery form 101 described above will be described.

[0053]

Figure 6 illustrates the operation of delivery form 101 in Figures 4a to 4c.

[0054]

In delivery form 101 in Figures 4a to 4c, as described above, the region of upper base material 110 that forms delivery slip 111 is peeled from lower base material 120 from peeling start end 119a toward peeling finish end 119b. Thus, as shown in Figure 6, the peeled region 103 where the

the adhesive rows.

[0059]

For example, as shown in Figure 7a, elliptical adhesive layers 40 may be provided in each of adhesive rows 41a to 41i. In this case, adhesive layers 40 are provided so that a short axis of an ellipse is perpendicular to adhesive rows 41a to 41i. This reduces the area that attaches upper base material 10 to lower base material 20 in peeled region 3 where the region of upper base material 10 that forms delivery slip 11 is to be peeled off from lower base material 20, and thus can reduce the adhesive force in peeled region 3, and can reduce stress applied to peeled region 3 at one time when the region of upper base material 10 that forms delivery slip 11 is peeled off from lower base material 20.

[0060]

Also, as shown in Figure 4b, triangular adhesive layers 40 may be provided in each of adhesive rows 41a to 41i. In this case, the triangle has a vertex on the side of peeling start end 19a, and has an area expanding toward peeling finish end 19b. Thus, the adhesive force that attaches upper base material 10 to lower base material 20 gradually increased from peeling start end 19a toward peeling finish end 19b. This allows the region of upper base material 10 that forms delivery slip 11 to be easily peeled off from lower base material 20 in addition to the operation described above.

[0061]

Also, as shown in Figure 4c, triangular adhesive layers 40 may be provided in each of adhesive rows 41a to 41i in a direction opposite to that in Figure 4b. In this case, the triangle has an area that decreases from peeling start end 19a toward peeling finish end 19b. Thus, the adhesive force that

Claim

[Claim 1]

A label in which an upper base material and a lower base material are laminated and peelably attached, and a release mount is peelably attached by a tacky layer laminated on a surface of the lower base material opposite to a surface joining the upper base material, wherein:

the upper base material and the lower base material are peelably attached by a plurality of pseudo adhesive structures provided like islands between the upper base material and the lower base material,

the plurality of pseudo adhesive structures are provided so that, for a line group passing through at least one of the plurality of pseudo adhesive structures among lines that extend from a peeling start end of the upper base material, from the lower base material toward a peeling finish end opposite to the peeling start end, the pseudo adhesive structure is present on at least one of the lines, but not all the lines that constitute the line group on any line perpendicular to the line group.

Delivery package 2 to which delivery form 1 is attached is delivered to the destination of delivery package 2 according to delivery information 18a, 18b printed or written in information indication regions 14a, 14b.

[0030]

Then, when delivery package 2 is delivered to the destination, a receipt stamp is stamped on stamp region 15 in delivery slip 11, and then delivery slip 11 is separated from delivery form 1.

[0031]

The region of upper base material 10 that forms delivery slip 11 is attached to lower base material 20 by adhesive layer 40, but can be peeled off from lower base material 20 and separated from delivery form 1 because release layer 50 is laminated on the attachment surface of the region. As shown in Figure 2a, the region of upper base material 10 that forms delivery slip 11 is peeled from peeling start end 19a.

[0032]

When the region of upper base material 10 that forms delivery slip 11 is peeled from peeling start end 19a, as shown in Figure 2b, notification information 21a that is included in print layer 21 that is laminated on lower base material 20 becomes visible. Then, the peeled region reaches peeling finish end 19b, and the region of upper base material 10 that forms delivery slip 11 is completely peeled off from lower base material 20 and carried back by the carrier.

[0033]

Now, the operation of delivery form 1 described above will be described.

[0034]

[0050]

The region of upper base material 110 that forms delivery slip 111 is attached to lower base material 120 by adhesive layer 140, but can be peeled off from lower base material 120 and separated from delivery form 101 because release layer 150 is laminated on the attachment surface of the region. As shown in Figure 5a, the region of upper base material 110 that forms delivery slip 111 is peeled from peeling start end 119a.

[0051]

When the region of upper base material 110 that forms delivery slip 111 is peeled from peeling start end 119a, as shown in Figure 5b, notification information 121a that is included in print layer 121 that is laminated on lower base material 120 becomes visible. Then, the peeled region reaches the peeling finish end 119b, and the region of upper base material 110 that forms delivery slip 111 is completely peeled from lower base material 120 and carried back by the carrier.

[0052]

Now, an operation of delivery form 101 described above will be described.

[0053]

Figure 6 illustrates the operation of delivery form 101 in Figures 4a to 4c.

[0054]

In delivery form 101 in Figures 4a to 4c, as described above, the region of upper base material 110 that forms delivery slip 111 is peeled from lower base material 120 from peeling start end 119a toward peeling finish end 119b. Thus, as shown in Figure 6, the peeled region 103 where the

the adhesive rows.

[0059]

For example, as shown in Figure 7a, elliptical adhesive layers 40 may be provided in each of adhesive rows 41a to 41i. In this case, adhesive layers 40 are provided so that a short axis of an ellipse is perpendicular to adhesive rows 41a to 41i. This reduces the area that attaches upper base material 10 to lower base material 20 in peeled region 3 where the region of upper base material 10 that forms delivery slip 11 is to be peeled off from lower base material 20, and thus can reduce the adhesive force in peeled region 3, and can reduce stress applied to peeled region 3 at one time when the region of upper base material 10 that forms delivery slip 11 is peeled off from lower base material 20.

[0060]

Also, as shown in Figure 7b, triangular adhesive layers 40 may be provided in each of adhesive rows 41a to 41i. In this case, the triangle has a vertex on the side of peeling start end 19a, and has an area expanding toward peeling finish end 19b. Thus, the adhesive force that attaches upper base material 10 to lower base material 20 gradually increased from peeling start end 19a toward peeling finish end 19b. This allows the region of upper base material 10 that forms delivery slip 11 to be easily peeled off from lower base material 20 in addition to the operation described above.

[0061]

Also, as shown in Figure 7c, triangular adhesive layers 40 may be provided in each of adhesive rows 41a to 41i in a direction opposite to that in Figure 7b. In this case, the triangle has an area that decreases from peeling start end 19a toward peeling finish end 19b. Thus, the adhesive force that

Claims

[Claim 1]

A label in which an upper base material and a lower base material are laminated and peelably attached, and a release mount is peelably attached by a tacky layer laminated on a surface of the lower base material opposite to a surface joining the upper base material, wherein:

the upper base material and the lower base material are peelably attached by a plurality of pseudo adhesive structures provided like islands between the upper base material and the lower base material,

the plurality of pseudo adhesive structures are provided so that, for a line group passing through at least one of the plurality of pseudo adhesive structures among lines that extend from a peeling start end of the upper base material, from the lower base material toward a peeling finish end opposite to the peeling start end, the pseudo adhesive structure is present on at least one of the lines, but not all the lines that constitute the line group on any line perpendicular to the line group.

[Claim 2]

The label according to claim 1, wherein
said like island is formed in a rectangular shape with a long side in the direction extending in parallel from peeling start end toward peeling finish end.
