ABSTRACT OF THE DISCLOSURE

VEHICLE TRAVELING CONTROL APPARATUS

After a push operation of an operating unit is started (at time t1), when a speed limit acquired by a speed limit acquisition ECU is switched from a first speed limit (for example, 100 km/h) to a second speed limit (for example, 120 km/h) at time t2 in a period in which a duration time of the push operation has not yet reached a long-push completion time, a driving support ECU sets a target speed Vset to the second speed limit at a time point at which the duration time of the push operation has reached the long-push completion time thereafter (at time t3).
