

Title of Invention: Safety Linkage (Laundry stick pivotal mount)

**The abstract:**

The invention is to improve user safety and reduce body strain during lifting of laundry for drying outside any high-rise residential building since the laundry stick is now able to be mounted from its almost vertical position instead of traditionally horizontal position as shown with reference to the accompanying user guide on page 3.

The safety linkage has two metal sections pivotally connected to each other to help a person in vertical mounting of loaded laundry stick. When in use, one of the sections is secured horizontally to a supported laundry stick receptacle by capping over it and the other section is adapted to receive a laundry stick, which in the resting position is aligned longitudinally with the first section.
