

NETWORK ACCESS METHOD, APPARATUS, AND SYSTEM

ABSTRACT

Embodiments of this application relate to the field of communication technologies, and provide a network access method, an apparatus, and a system, to resolve a problem caused when
5 a first terminal attempts to access a non-public network. The method includes: A first terminal sends a first message to an access management network element in a first non-public network, where the first message is used to request to register the first terminal with the first non-public network. The first terminal receives a second message from the access management network element, where the second message is used to indicate that registration of the first terminal with
10 the first non-public network is rejected, the second message includes first indication information, and the first indication information indicates that access of the first terminal to the first non-public network is forbidden. The first terminal adds information about the first non-public network to a forbidden network list of the first terminal based on the first indication information.
