

ANNOTATION-INFORMATION ADDING PROGRAM, INFORMATION PROCESSING
APPARATUS, AND ANNOTATION-INFORMATION ADDING METHOD

ABSTRACT

An annotation-information adding program causes a computer to function as an adding unit, an evaluating unit, and a setting unit. The adding unit adds annotation information to target information including multiple targets based on input from a first inputter. The evaluating unit evaluates reliability of the first inputter and reliability of a second inputter by comparing annotation information already added to at least one of the multiple targets by the second inputter with annotation information added by the first inputter. The setting unit sets a target range in the target information intended for requesting the first inputter to add annotation information based on the reliability of the first inputter and the reliability of the second inputter.
