

PROCESSING EQUIPMENT

ABSTRACT

Processing equipment including a processing apparatus including a chuck table, a suction apparatus supplying a negative pressure to the chuck table, a first base that supports the processing apparatus, and a second base that supports the suction apparatus. The second base has, at a bottom part thereof, multiple leg parts that are disposed in such a manner as to penetrate through through-holes provided in the first base, without getting contact with the first base, and are each capable of extension and contraction. The second base is allowed to be supported by the first base through contracting of each of the multiple leg parts when the processing and suction apparatuses are to be conveyed. The second base stands by itself without getting contact with the first base, through extending of each of the multiple leg parts when the processing and suction apparatuses are to be installed on a floor surface.
