Abstract

A control panel (10) for use in a construction engine
05 comprises a screen (38) and a housing (24) carrying
the latter. A variety of keys (40) is arranged on the
housing (24). The keys (40) actuating control signal gene-
rators differ as to their geometric position, as to their
size as to the actuating direction or as to the resistance
10 to be overcome upon actuation. Thus the individual keys
can be discerned and recognized in tactile manner.
