SAM-competitive PRMT5 inhibitor (Kruykov et al., 2016; Marjon et al., 2016 and Markarov et al., 2016).

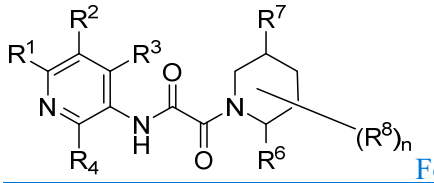

[0003] PRMT5 is a type II arginine methyltransferase that regulates essential cellular functions, including the regulation of cell cycle progression, apoptosis and the DNA-damage response, by symmetrically dimethylating proteins involved in transcription and signaling (Koh, Bezzi and Guccione *Curr Mol Bio Rep* 2015 and Wu et al *Nat Rev Drug Discovery* 2021). However, data from genome-wide genetic perturbation screens using shRNA has revealed a selective requirement for PRMT5 activity in *MTAP*-deleted cancer cell lines (Kruykov et al., 2016; Marjon et al., 2016 and Markarov et al., 2016). The accumulation of MTA caused by *MTAP*-deletion in these cell lines partially inhibits PRMT5, rendering those cells selectively sensitive to additional PRMT5 inhibition.

[0004] PRMT5 inhibitors have been developed, yet they do not demonstrate selectivity for MTAP-deleted cancer cell lines. This lack of selectivity can be explained by the mechanisms of action of the inhibitors, as they are either SAM-uncompetitive or SAM-competitive inhibitors and therefore, MTAP-agnostic (Kruykov et al., 2016; Marjon et al., 2016 and Markarov et al., 2016) However, if a PRMT5 inhibitor were developed that leverages the accumulation of MTA by binding in an MTA-uncompetitive, non-competitive or mixed mode manner or in a MTA-cooperative binding manner, it could demonstrate selectivity for MTAP-deleted tumor cells.

b) comparing the test sample with a reference, wherein MTAP deficiency and/or MTA accumulation in said test sample compared to the reference indicates the cancer in said subject will respond to therapeutic treatment with a PRMT5 inhibitor; and

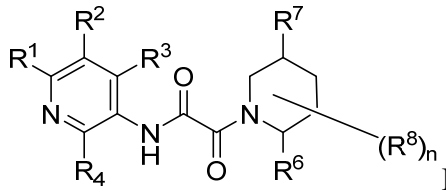

c) administering a therapeutically effective amount of a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) as defined herein or a pharmaceutical composition thereof to the subject identified in step b).
