

SHAVING HEAD AND PROCESS FOR PEELING OF CYLINDERS,
CYLINDER TUBES AND THE LIKE

ABSTRACT

In order to eliminate as far as possible errors in roundness and the occurrence of helical waves, a shaving head is provided with peeling blades arranged in a radially displaceable manner in the shaving head, with which at least three
5 peeling blades are provided for.

With such an embodiment of the shaving head, both the requirement for self-centering of the peeling blade set as well as the requirement for circular peeling geometry with consistent cutting depth are fulfilled.
