

ABSTRACT

HAIR STYLING DEVICE

This invention relates to a hair styling device (10) having a body (12) defining a chamber (16) adapted to accommodate a length of hair (26), the length of hair being styled whilst it is located within the chamber. The chamber has a primary opening (24) through which the length of hair may pass into the chamber. A rotatable element (34) is provided which is adapted to engage the length of hair adjacent to the primary opening. An elongate member (20) is located within the chamber (16), the length of hair being wound around the elongate member by the rotatable element, the elongate member having a free end. The chamber has a secondary opening (50) through which the length of hair may pass out of the chamber, the secondary opening being located adjacent to the free end of the elongate member. A movable abutment (52) is provided which can engage the length of hair (26) in use, the movable abutment having an open position in which the length of hair can pass through the secondary opening (50), and a closed position in which the length of hair is retained within the chamber (16).
