

SYSTEM AND METHOD FOR PROPAGATING ALGAE AND/OR ZOO PLANKTONS

ABSTRACT

A system for propagating algae and/or zoo planktons includes a generally flat base and a plurality of optically transparent containers mounted on the base. Each container is configured to contain a water-based medium to support algae and/or zoo planktons propagation. Each container is disposed at the same distance from a center of the base as the other containers. Each container is rotatable relative to the base about a respective upright axis extending from the base through said container.
