

BINDING INDIVIDUAL PAGES TOGETHER IN A PRINTHEAD ARRANGEMENT

ABSTRACT

A printing device includes an adhesive applicator for the application of a strip of adhesive to one or both sides of pages of paper adjacent an edge to be bound. A pinch roller drives the individual and unstacked pages past a print head which prints text and/or images onto the page. The adhesive applicator is situated adjacent the print head and applies the adhesive strip(s) to the pages as they move past the print head.
