

MESSAGE DEVICE AND CHAIR-TYPE MESSAGE APPARATUS EQUIPPED
WITH THE MESSAGE DEVICE

ABSTRACT

Provided is a message device for giving a variety of non-boring kneading and message feelings to a to-be-treated part. The message device (1) of the invention comprises: paired left and right message members (10, 11) having a treatment element (91 to 94), and a message mechanism (12) for operating at least one of the paired message members (10, 11) to cause the treatment elements (91 to 94) to move close to and away from each other in the horizontal direction to produce kneading actions. The message member (10, 11) has an arm member (15, 16) extending substantially perpendicularly to the approaching/separating direction, and the treatment element (91 to 94) is disposed at the front end of the arm member (15, 16) so that an extended line L extending along the protruding direction of the arm member (15, 16) passes through the interior of the treatment element (91 to 94).
