

Abstract

Apparatus for clamping a device (3) to an elongate body (2) extending in a longitudinal direction (L), which apparatus is displaceable to and fro along a longitudinal extent of the elongate body and is provided with a self-locking mechanism which comprises at least one clamping element (20) which is pivotable about an associated axis of rotation (21) between at least one clamping position and a neutral position, wherein the at least one clamping element (20) has an arm running away from the axis of rotation (21) thereof, with at least one clamping surface (22, 23) arranged at an arm end remote from the axis of rotation (21), and the at least one clamping surface (22, 23) has the same relative position with respect to the arm in the at least one clamping position and in the neutral position and in each position along the pivoting movement.
