

ABSTRACT

An exhaust with a housing, in which a working space 3 is located which is open on one side. In order to reduce the risk of a blow-out of harmful substances and in particular to avoid dead-space areas at the internal surfaces of the side walls and the bottom in working space 3, devices are provided which blow in supply-air jets 21, 22 at an acute angle to the internal surfaces of working space 3 in such a way that these supply-air jets 21, 22 lie next to the internal surfaces.
