(54) Title: TRANSACTION SYSTEM WITH ENHANCED INSTRUCTION RECOGNITION

(57) Abstract: A transaction system is provided in which a plurality of participating system members each has access to a communications device (2, 3, 4, 5) so as to operatively communicate via an associated network with a computerized server (1) in order to instruct the initiation or conduct of a transaction, typically a financial transaction, by operation of the computerized server consequent on data inputted by a particular system member. The system includes at least one data base in which there is retained data relating to at least some possible or previous transactions or both that may be conducted by the particular system member. Selection means are provided for selecting one of said possible or previous transactions that best represents data inputted in respect of any particular target transaction on the basis of artificial intelligence such that data inputted in different ways or with different degrees of accuracy can result in the same target transaction being selected by the selection means. The selected transaction is communicated to the particular system member whose confirmation is required of the correctness or otherwise of the selected target transaction.
