

Abstract

The utility model provides a star-shaped assembly for a glass curtain wall and belongs to the technical field of building materials. The star-shaped assembly comprises two cross-connected oblique arms, and a horizontal arm which
5 connects with the two oblique arms and intersects with the two oblique arms at one point. The oblique arms and the horizontal arm are solid and have two ends formed with connectors. The star-shaped assembly is fabricated by a CNC machining process, and the oblique arms and the horizontal arm are solid, so that the assembly has higher strength and is not prone to deformation during
10 fabrication; and the assembly can be accurately machined according to required installation dimensions, thereby facilitating installation and saving installation time and construction costs.
