BINDER AND FILING INSTRUMENT

ABSTRACT

A binder (1) includes: a base member (2) having an elongated groove (4) extending in a predetermined direction; a binding leg extending through a through-hole (5) provided in the elongated groove (4) to be passed through the base member (2) and having flexibility; a slide member (3) sliding on the base member (2) in the predetermined direction and sandwiching the binding leg within the elongated groove according to a sliding position of the slide member; and retaining means (8, 9a, 9b) for retaining the binding leg within the elongated groove (4) in a bent state when sandwiching the binding leg within the elongated groove (4) through sliding of the slide member (3). As a result, the binding leg is fixed in position more reliably and operability at the time of binding is satisfactory.
