

ABSTRACT

Provided is an air cleaner with a simple structure capable of appropriately notifying filter replacement timing. In the air cleaner (A), a control unit (50) sends to a computing unit (60) a total amount of air that has passed through a dust collecting unit (20) in a predetermined period and a total dust collecting time. The computing unit (60) acquires information about an installation space volume and the amount of dust contained in the installation space, calculates a total dust collection amount that is the total amount of dust collected by the dust collecting unit, based on the total amount of air that has passed through the dust collecting unit (20), the total dust collecting time, the installation space volume, and the amount of dust contained in the installation space, and notifies the calculation result.
