

**METHOD FOR PREPARING CHA-TYPE MOLECULAR SIEVES USING
COLLOIDAL ALUMINOSILICATE AND NOVEL STRUCTURE DIRECTING
AGENTS**

5 FIELD OF THE INVENTION

[0001] The present invention is directed to a process for preparing CHA-type molecular sieves using a colloidal aluminosilicate composition and a cationic structure directing agent selected from the group consisting of N-cyclohexyl-N-methylpyrrolidinium, N-methyl-N-(3-methylcyclohexyl)pyrrolidinium, N-ethyl-N-(3-methylcyclohexyl)pyrrolidinium, and
10 mixtures thereof.

BACKGROUND OF THE INVENTION

[0002] Molecular sieves are a commercially important class of crystalline materials. They have distinct crystal structures with ordered pore structures which are demonstrated by
15 distinct X-ray diffraction patterns. The crystal structure defines cavities and pores which are characteristic of the different species.

[0003] Molecular sieves identified by the International Zeolite Associate (IZA) as having the structure code CHA are known. For example, the molecular sieve known as SSZ-13 is a known crystalline CHA material. It is disclosed in U.S. Patent No. 4,544,538,
20 issued October 1, 1985 to Zones. In that patent, the SSZ-13 molecular sieve is prepared in the presence of a N-alkyl-3-quinuclidinol cation, a N,N,N-trialkyl-1-adamantammonium cation and/or, and N,N,N-trialkyl-2-exoaminonorborene cation as the structure-directing agent (SDA).

[0004] U.S. Publication No. 2007-0286798 to Cao et al., published December 13, 2007,
25 discloses the preparation of CHA-type molecular sieves using various SDAs, including a N,N,N-trimethyl-2-adamantammonium cation.

[0005] However, known SDAs useful for making CHA materials are complex and typically not available in quantities necessary to produce CHA materials on a commercial scale. In addition, there is a continuous need to reduce the concentration of known CHA
30 SDAs in the reaction mixture to an absolute minimum, or replace them entirely with SDAs that are cheaper, less complex and/or reduce the time necessary to form product.

[0006] It has now been found that CHA-type molecular sieves can be prepared using a colloidal aluminosilicate in the presence of at least one of the novel structure directing agents described herein below.

5

SUMMARY OF THE INVENTION

[0007] In accordance with the present invention there is provided a method of preparing
CHA-type molecular sieves by contacting under crystallization conditions (1) a colloidal
aluminosilicate composition; (2) at least one of the novel structure directing agents
represented by structures (1) through (3) below; (3) at least one source of an element selected
from Groups 1 and 2 of the Periodic Table; and (4) hydroxide ions.

10

[0008] The present invention also includes a process for preparing a CHA-type molecular
sieve by:

(a) preparing a reaction mixture containing: (1) a colloidal aluminosilicate
composition; (2) at least one of the novel structure directing agents represented by structures
(1) through (3) below; (3) at least one source of an element selected from Groups 1 and 2 of
the Periodic Table; (4) hydroxide ions; and (5) water; and

15

(b) subjecting the reaction mixture to crystallization conditions sufficient to form
crystals of the CHA-type molecular sieve.

[0009] Where the molecular sieve formed is an intermediate material, the process of the
present invention includes a further post-crystallization processing in order to achieve the
target molecular sieve (e.g. by post-synthesis heteroatom lattice substitution or acid leaching).

20

[0010] The present invention also provides a CHA-type molecular sieve having a
composition, as-synthesized and in the anhydrous state, in terms of mole ratios, as follows:

	Broadest	Secondary
$\text{SiO}_2 / \text{Al}_2\text{O}_3$	10 – 300	20 – 100
Q / SiO_2	0.05 – 0.4	0.1 – 0.3
M / SiO_2	0.01 – 0.3	0.02 – 0.1

wherein:

(1) M is selected from the group consisting of elements from Groups 1 and 2 of
the Periodic Table; and

(2) Q is at least one of the novel structure directing agents represented by
structures (1) through (3) below.

15

DETAILED DESCRIPTION OF THE INVENTION

Introduction

[0017] The term “Periodic Table” refers to the version of IUPAC Periodic Table of the Elements dated June 22, 2007, and the numbering scheme for the Periodic Table Groups is as described in Chemical and Engineering News, 63(5), 27 (1985).

20 [0018] The term “molecular sieve” includes (a) intermediate and (b) final or target molecular sieves and zeolites produced by (1) direct synthesis or (2) post-crystallization treatment (secondary synthesis). Secondary synthesis techniques allow for the synthesis of a target material from an intermediate material by heteroatom lattice substitution or other techniques. For example, an aluminosilicate can be synthesized from an intermediate borosilicate by post-crystallization heteroatom lattice substitution of the Al for B. Such techniques are known, for example as described in U.S. Patent No. 6,790,433 to C.Y. Chen and Stacey Zones, issued September 14, 2004.

25 [0019] The term “CHA-type molecular sieve” includes all molecular sieves and their isotypes that have been assigned the International Zeolite Associate framework code CHA, as described in the *Atlas of Zeolite Framework Types*, eds. Ch. Baerlocher, L.B. McCusker and D.H. Olson, Elsevier, 6th revised edition, 2007. The *Atlas of Zeolite Framework Types* classifies two differently named materials, among others, as having this same topology: SSZ-13 and SSZ-62.

30 [0020] It will be understood by a person skilled in the art that the CHA-type molecular sieve materials made according to the process described herein may contain impurities, such as amorphous materials; unit cells having non-CHA framework topologies (e.g., MFI, MTW); and/or other impurities (e.g., heavy metals and/or organic hydrocarbons).

5 [0021] Where permitted, all publications, patents and patent applications cited in this application are herein incorporated by reference in their entirety; to the extent such disclosure is not inconsistent with the present invention.

[0022] Unless otherwise specified, the recitation of a genus of elements, materials or other components, from which an individual component or mixture of components can be
10 selected, is intended to include all possible sub-generic combinations of the listed components and mixtures thereof. Also, "include" and its variants are intended to be non-limiting, such that recitation of items in a list is not to the exclusion of other like items that may also be useful in the materials, compositions and methods of this invention.

[0023] The present invention is directed to a method of making CHA-type molecular
15 sieves using a colloidal aluminosilicate and a cyclic nitrogen-containing cation structure directing agent (SDA) selected from the group consisting of cations represented by structures (1) through (3), and mixtures thereof:

N-cyclohexyl-N-methylpyrrolidinium cation

N-methyl-N-(3-methylcyclohexyl)pyrrolidinium cation

N-ethyl-N-(3-methylcyclohexyl)pyrrolidinium cation

5 Reaction Mixture

[0024] In general, the CHA-type molecular sieve is prepared by:

(a) preparing a reaction mixture containing: (1) a colloidal aluminosilicate composition; (2) at least one of the novel structure directing agents represented by structures (1) through (3) herein; (3) at least one source of an element selected from Groups 1 and 2 of the Periodic Table; (4) hydroxide ions; and (5) water; and

(b) subjecting the reaction mixture to crystallization conditions sufficient to form crystals of the CHA-type molecular sieve.

[0025] Where the molecular sieve formed is an intermediate material, the process of the present invention includes a further step of synthesizing a target molecular sieve by post-synthesis techniques, such as heteroatom lattice substitution techniques and acid leaching.

[0026] The composition of the reaction mixture from which the CHA-type molecular sieve is formed, in terms of molar ratios, is identified in Table 1 below:

TABLE 1

Reactants	Broad	Subembodiment
$\text{SiO}_2 / \text{Al}_2\text{O}_3$	10 – 300	20 – 100
M / SiO_2	0.01 – 0.3	0.02 – 0.1
Q / SiO_2	0.05 – 0.4	0.1 – 0.3
$\text{OH}^- / \text{SiO}_2$	0.1 – 0.8	0.2 – 0.4
$\text{H}_2\text{O} / \text{SiO}_2$	5 – 50	15 – 30

wherein compositional variables M and Q are as described herein above.

[0027] Colloidal aluminosilicate compositions useful in the process described herein, and for manufacturing molecular sieves generally, are well known in the art and commercially available from suppliers such as Nalco.

[0028] As described herein above, for each embodiment described herein, the reaction mixture may be formed using at least one source of an element selected from Groups 1 and 2 of the Periodic Table (referred to herein as M). In one subembodiment, the reaction mixture is formed using a source of an element from Group 1 of the Periodic Table. In another subembodiment, the reaction mixture is formed using a source of sodium (Na). Any M-containing compound which is not detrimental to the crystallization process is suitable. Sources for such Groups 1 and 2 elements include oxides, hydroxides, nitrates, sulfates, halides, oxalates, citrates and acetates thereof.

5 **[0029]** The SDA cation is typically associated with anions (X^-) which may be any anion that is not detrimental to the formation of the zeolite. Representative anions include elements from Group 17 of the Periodic Table (e.g., fluoride, chloride, bromide and iodide), hydroxide, acetate, sulfate, tetrafluoroborate, carboxylate, and the like.

10 **[0030]** The reaction mixture can be prepared either batch wise or continuously. Crystal size, morphology and crystallization time of the molecular sieve described herein may vary with the nature of the reaction mixture and the crystallization conditions.

Crystallization and Post-Synthesis Treatment

15 **[0031]** In practice, the molecular sieve is prepared by:
 (a) preparing a reaction mixture as described herein above; and
 (b) maintaining the reaction mixture under crystallization conditions sufficient to form the molecular sieve. (See, Harry Robson, *Verified Syntheses of Zeolitic Materials*, 2nd revised edition, Elsevier, Amsterdam (2001)).

20 **[0032]** The reaction mixture is maintained at an elevated temperature until the molecular sieve is formed. The hydrothermal crystallization is usually conducted under pressure, and usually in an autoclave so that the reaction mixture is subject to autogenous pressure, at a temperature between 130°C and 200°C, for a period of one to six days.

25 **[0033]** The reaction mixture may be subjected to mild stirring or agitation during the crystallization step. It will be understood by a person skilled in the art that the molecular sieves described herein may contain impurities, such as amorphous materials, unit cells having framework topologies which do not coincide with the molecular sieve, and/or other impurities (e.g., organic hydrocarbons).

30 **[0034]** During the hydrothermal crystallization step, the molecular sieve crystals can be allowed to nucleate spontaneously from the reaction mixture. The use of crystals of the molecular sieve as seed material can be advantageous in decreasing the time necessary for complete crystallization to occur. In addition, seeding can lead to an increased purity of the product obtained by promoting the nucleation and/or formation of the molecular sieve over any undesired phases. When used as seeds, seed crystals are added in an amount between 1% and 10% of the weight of the source for silicon used in the reaction mixture.

35 **[0035]** Once the molecular sieve crystals have formed, the solid product is separated from the reaction mixture by standard mechanical separation techniques such as filtration. The

5 crystals are water-washed and then dried to obtain the as-synthesized molecular sieve crystals. The drying step can be performed at atmospheric pressure or under vacuum.

[0036] The molecular sieve can be used as-synthesized, but typically will be thermally treated (calcined). The term "as-synthesized" refers to the molecular sieve in its form after crystallization, prior to removal of the SDA. The SDA can be removed by thermal treatment
10 (e.g., calcination), preferably in an oxidative atmosphere (e.g., air, gas with an oxygen partial pressure of greater than 0 kPa) at a temperature readily determinable by one skilled in the art sufficient to remove the SDA from the molecular sieve. The SDA can also be removed by photolysis techniques (e.g. exposing the SDA-containing molecular sieve product to light or electromagnetic radiation that has a wavelength shorter than visible light under conditions
15 sufficient to selectively remove the organic compound from the molecular sieve) as described in U.S. Patent No. 6,960,327 to Navrotsky and Parikh, issued November 1, 2005.

[0037] The molecular sieve can subsequently be calcined in steam, air or inert gas at temperatures ranging from about 200°C to about 800°C for periods of time ranging from 1 to 48 hours, or more. Usually, it is desirable to remove the extra-framework cation (e.g. H⁺) by
20 ion-exchange or other known method and replace it with hydrogen, ammonium, or any desired metal-ion.

[0038] Where the molecular sieve formed is an intermediate material, the target molecular sieve can be achieved using post-synthesis techniques such as heteroatom lattice substitution techniques. The target molecular sieve (e.g. silicate SSZ-13) can also be
25 achieved by removing heteroatoms from the lattice by known techniques such as acid leaching.

[0039] The molecular sieve made from the process of the present invention can be formed into a wide variety of physical shapes. Generally speaking, the molecular sieve can be in the form of a powder, a granule, or a molded product, such as extrudate having a particle
30 size sufficient to pass through a 2-mesh (Tyler) screen and be retained on a 400-mesh (Tyler) screen. In cases where the catalyst is molded, such as by extrusion with an organic binder, the molecular sieve can be extruded before drying, or, dried or partially dried and then extruded.

[0040] The molecular sieve can be composited with other materials resistant to the
35 temperatures and other conditions employed in organic conversion processes. Such matrix materials include active and inactive materials and synthetic or naturally occurring zeolites as well as inorganic materials such as clays, silica and metal oxides. Examples of such materials and the manner in which they can be used are disclosed in U.S. Patent No. 4,910,006, issued

5 May 20, 1990 to Zones et al., and U.S. Patent No. 5,316,753, issued May 31, 1994 to Nakagawa.

Characterization of the Molecular sieve

10 [0041] The CHA molecular sieves made by the process of the present invention have a composition, as-synthesized and in the anhydrous state, as described in Table 2 (in terms of mole ratios), wherein compositional variables M and Q are as described herein above:

TABLE 2

	Broadest	Secondary
SiO ₂ / Al ₂ O ₃	10 – 300	20 – 100
Q / SiO ₂	0.05 – 0.4	0.1 – 0.3
M / SiO ₂	0.01 – 0.3	0.02 – 0.1

15 [0042] The CHA-type molecular sieves synthesized by the process of the present invention are characterized by their X-ray diffraction pattern (XRD). X-ray diffraction patterns representative of CHA-type molecular sieves can be referenced in M. M. J. Treacy et al., *Collection of Simulated XRD Powder Patterns for Zeolites*, 5th Revised Edition, 2007 of the International Zeolite Association. Minor variations in the diffraction pattern can result from variations in the mole ratios of the framework species of the particular sample due to
 20 changes in lattice constants. In addition, sufficiently small crystals will affect the shape and intensity of peaks, leading to significant peak broadening. Minor variations in the diffraction pattern can also result from variations in the organic compound used in the preparation and from variations in the Si/Al mole ratio from sample to sample. Calcination can also cause minor shifts in the X-ray diffraction pattern. Notwithstanding these minor perturbations, the
 25 basic crystal lattice structure remains unchanged.

[0043] The powder X-ray diffraction patterns presented herein were collected by standard techniques. The radiation was CuK- α radiation. The peak heights and the positions, as a function of 2θ where θ is the Bragg angle, were read from the relative intensities of the peaks, and d, the interplanar spacing in Angstroms corresponding to the recorded lines, can be
 30 calculated.

EXAMPLES

[0044] The following examples demonstrate but do not limit the present invention.

5

EXAMPLE 1Synthesis of Cyclohexenylpyrrolidine

[0045] Cyclohexenylpyrrolidine was prepared as described in the procedure below illustrated in Scheme 1. In a 3-neck reaction flask equipped with a mechanical stirrer and heating mantle, a 2 molar equivalent of pyrrolidine were mixed with 1 molar equivalent of cyclohexanone in dry cyclohexane to make a 1M solution with respect to the cyclohexanone. To the mixture, 2 molar equivalents of anhydrous MgSO_4 (as dehydrating agent) were added. The resulting mixture was refluxed for 94 hours. The progress of the reaction was monitored by NMR analysis.

[0046] After heating for 96 hours, the reaction was completed and reaction mixture was cooled down, filtered and concentrated on a rotary evaporator to remove excess pyrrolidine and cyclohexanone. The obtained oil was dissolved in cyclohexane and hydrogenated at 60 psi hydrogen pressure in the presence of 10% palladium on activated carbon (10 mol% with respect the produced cyclohexenylpyrrolidine) on a hydrogenation Parr. The reaction was left to gently shake overnight. Once hydrogenation is complete, the reaction mixture was filtered through a fritted glass funnel and the filtrate was concentrated on a rotary evaporator to remove the solvent (cyclohexane). The desired cyclohexenylpyrrolidine was obtained in 91% yield.

SCHEME 1

25

5 [0047] In some instances when some unreacted cyclohexanone is still in the reaction mixture, the product after hydrogenation was purified by adding 3M HCl solution to the mixture (after filtering out the palladium/carbon catalyst) and left to stir for 15-20 minutes. The resulting mixture was then extracted with diethyl ether to remove the cyclohexanone from the mixture and leaving behind the cyclohexylpyrrolidinium hydrochloride salt. The water layer containing cyclohexylpyrrolidinium hydrochloride salt is separated and then
10 neutralized with NaOH solution to a pH of 9-10. The free cyclohexylpyrrolidine is extracted with ethyl acetate, dried over MgSO_4 and concentrated on a rotary evaporator at reduced pressure to give the desired product free from any impurities.

EXAMPLE 2

Synthesis of N-(3-methylcyclohexyl)pyrrolidine

15 [0048] As illustrated in Scheme 2 below, N-(3-methylcyclohexyl)pyrrolidine was synthesized using the procedure described in Example 1 above using 3-methylcyclohexanone in place of cyclohexanone. The condensation reaction yields an isomeric mixture of N-(3-methylcyclohex-1-enyl)pyrrolidine and N-(5-methylcyclohex-1-enyl)pyrrolidine which upon
20 hydrogenation yielded the desired a N-(3-methylcyclohexyl)pyrrolidine in 88% yield.

SCHEME 2

5

EXAMPLE 3Synthesis of N-Methyl-N-Cyclohexylpyrrolidinium Hydroxide

[0049] Referring to Scheme 3 below, N-cyclohexylpyrrolidine prepared in Example 1 (1 molar equivalent) was dissolved in methanol to 0.5M concentration in a three neck reaction flask equipped with a mechanical stirrer and reflux condenser. To the methanolic solution of cyclohexylpyrrolidine, 2 molar equivalents of methyl iodide were added, and the resulting mixture was left to stir overnight. The mixture was heated to reflux and left to stir at reflux for 4 hours. The reaction was cooled down and left to stir overnight. The reaction was complete. The reaction mixture was concentrated on a rotary evaporator. The resulting tan-colored solids were dissolved in isopropyl alcohol and then precipitated out from solution by adding diethyl ether. The precipitate was filtered out and dried on a rotary evaporator at reduced pressure and in hot water bath at 80 °C to give the desired N-methyl-N-cyclohexylpyrrolidinium iodide in 86% yield. N-Methyl-N-cyclohexylpyrrolidinium iodide was converted to the hydroxide by ion-exchanging the iodide ion with hydroxide ion. In a polyethylene plastic bottle, N-methyl-N-cyclohexylpyrrolidinium iodide salt was dissolved in deionized water (1 mmol salt/10 ml H₂O). Then Bio-Rad AG 1-X8 resin (1.1 g resin/mmol salt) was added and the slurry-like mixture was gently stirred overnight. The exchange solution was then filtered and a small aliquot was titrated with 0.1N HCl to give 92% yield of the N-methyl-N-cyclohexylpyrrolidinium hydroxide.

5

SCHEME 3

**EXAMPLE 4**Synthesis of N-Methyl-N-(3-methylcyclohexyl)pyrrolidinium Hydroxide

[0050] Referring to Scheme 4 below, N-(3-methylcyclohexyl)pyrrolidine prepared in Example 2 above was quaternized with methyl iodide in a similar fashion to the procedure described in in example 3. The quaternization afforded the desired N-methyl-N-(3-methylcyclohexyl)pyrrolidinium iodide in 94% yield. The resulting iodide salt was exchanged with Bio-Rad AG 1-X8 ion-exchange resin as described in example 3 to give N-methyl-N-(3-methylcyclohexyl)pyrrolidinium hydroxide in 98% yield (titration analysis).

5

SCHEME 4

**EXAMPLE 5**Synthesis of N-Ethyl-N-(3-methylcyclohexyl)pyrrolidinium Hydroxide

- 10 **[0051]** As shown in Scheme 5, N-(3-methylcyclohexyl)pyrrolidine prepared in Example 2 above was quaternized with ethyl iodide in a similar fashion to the procedure described in example 5 with the exception of using ethyl iodide in place of methyl iodide. The quaternization afforded the desired N-ethyl-N-(3-methylcyclohexyl)pyrrolidinium iodide in 85% yield. The resulting N-ethyl-N-(3-methylcyclohexyl)pyrrolidinium iodide salt was
- 15 exchanged with Bio-Rad AG 1-X8 ion-exchange resin as described in example 3 to give N-methyl-N-(3-methylcyclohexyl)pyrrolidinium hydroxide in 88% yield (by titration).

5

SCHEME 5

**EXAMPLE 6**Synthesis of Al-SSZ-13 (Al-CHA) Using N-Cyclohexyl-N-methylpyrrolidinium Cation

- 10 **[0052]** In a 23 CC Teflon liner, 3.6 g of 0.63M of N-cyclohexyl-N-methylpyrrolidinium hydroxide solution (2 mmol SDA), 3 g of 1N KOH solution, and 5.3 g Nalco colloidal aluminosilicate (containing ~19 wt.% solids and a SiO₂/Al₂O₃ ratio of ~35) were mixed and stirred with a Teflon spatula until a homogenous gel was obtained. The resulting gel was capped off and sealed in an autoclave that was affixed to a rotating spit (~43 rpm) in an oven
- 15 and heated at 170° C. The crystallization progress was followed by Scanning Electron Microscopy analysis and by monitoring the pH of the reaction gel. The reaction was completed after heating for 7 days to give a clear solution and a fine powder precipitate with a pH of 12.1. The reaction solution was filtered using a fritted glass funnel. The obtained solids were thoroughly rinsed with deionized water (1 liter) and were air-dried overnight.
- 20 Then, the solids were further dried in an oven at 125° C for 1hr. The reaction yielded 0.92 g

5 of pure SSZ-13 (CHA) as indicated by SEM and powder XRD analysis and with crystal size of 0.5 micron. The resulting XRD pattern for the as-made product is shown in Figure 1.

[0053] The as-made sample was calcined in air in a muffle furnace oven from room temperature to 120° C at a rate of 1° C/minute and held at 120° C for 2 hours. The temperature was then ramped up to 540° C at a rate of 1° C/minute. The sample was held at 10 540° C for 5 hrs. The temperature was increased at the same rate (1° C/min) to 595° C and held there for 5 hrs. Upon calcination, there was a weight loss ranging from 20%. The resulting XRD pattern for the calcined product is shown in Figure 2.

EXAMPLE 7

15 [0054] Example 6 above was repeated but this time the reaction was seeded with 0.06 g of Al-SSZ-13 (Al-CHA). The reaction was completed in 5 days to give 0.96 g of SSZ-13.

EXAMPLE 8

Synthesis of Al-SSZ-13 (Al-CHA) Using

N-Methyl-N-(3-methylcyclohexyl)pyrrolidinium Cation

20 [0055] Example 6 was repeated exactly but replacing the SDA with 3.3 g of 0.69M of N-methyl-N-(3-methylcyclohexyl)pyrrolidinium hydroxide solution. The reaction was complete in 6 days to give 0.84 g of pure crystalline Al-SSZ-13 ranging from 0.5-3 micron.

[0056] The Al-SSZ-13 product was analyzed by powder XRD spectroscopy.

25 The resulting XRD pattern for the as-made product is shown in Figure 3.

[0057] The as-made product was calcined in air in a muffle furnace oven from room temperature to 120° C at a rate of 1° C/minute and held at 120° C for 2 hours. The temperature was then ramped up to 540° C at a rate of 1° C/minute. The sample was held at 540° C for 5 hrs. The temperature was increased at the same rate (1° C/min) to 595° C and 30 held there for 5 hrs. Upon calcination, there was a weight loss ranging from 19%. The resulting XRD pattern for the calcined product is shown in Figure 4.

EXAMPLE 9

[0058] Example 8 was repeated with seeding with 0.05 g Al-SSZ-13. The reaction was 35 complete in 4 days to give 1 g of pure CHA (Al-SSZ-13).

5

EXAMPLE 10Synthesis of Al-SSZ-13 (Al-CHA) UsingN-Ethyl-N-(3-methylcyclohexyl)pyrrolidinium Cation

[0059] Example 6 above was repeated using 3.5 g of 0.68 M solution of N-ethyl-N-(3-methylcyclohexyl) pyrrolidinium hydroxide as structure-directing agent. The reaction was
10 complete after heating for 14 days to give 0.89 g of pure Al-CHA (Al-SSZ-13) with crystal size of 0.5-1 micron.

[0060] The Al-SSZ-13 product was analyzed by powder XRD spectroscopy.

The resulting XRD pattern for the as-made product is shown in Figure 5.

[0061] The as-made product was calcined in air in a muffle furnace oven from room
15 temperature to 120° C at a rate of 1° C/minute and held at 120° C for 2 hours. The temperature was then ramped up to 540° C at a rate of 1° C/minute. The sample was held at 540° C for 5 hrs. The temperature was increased at the same rate (1° C/min) to 595° C and held there for 5 hrs. Upon calcination, there was a weight loss ranging from 21%. . The resulting XRD pattern for the calcined product is shown in Figure 6.

20

EXAMPLE 11

[0062] Example 10 was repeated and seeded with 0.07 g Al-SSZ-13. The crystallization was complete in 8 days to give 0.98 g of pure SSZ-13.

WHAT IS CLAIMED IS:

1. A method of preparing a CHA-type molecular sieve, comprising:
 - (a) preparing a reaction mixture containing (1) a colloidal aluminosilicate (2) a cationic structure directing agent selected from the group consisting of N-cyclohexyl-N-methylpyrrolidinium, N-methyl-N-(3-methylcyclohexyl)pyrrolidinium, N-ethyl-N-(3-methylcyclohexyl)pyrrolidinium, and mixtures thereof; (3) at least one source of an element selected from Groups 1 and 2 of the Periodic Table; (4) hydroxide ions; and (5) water; and
 - (b) subjecting the reaction mixture to crystallization conditions sufficient to form crystals of the CHA-type molecular sieve.

2. The method of Claim 1, wherein the molecular sieve is prepared from a reaction mixture comprising, in terms of mole ratios, the following:

SiO ₂ / Al ₂ O ₃	10 – 300
M / SiO ₂	0.01 – 0.3
Q / SiO ₂	0.05 – 0.4
OH ⁻ / SiO ₂	0.1 – 0.8
H ₂ O / SiO ₂	5 – 50

wherein:

- (1) M is the at least one element selected from Groups 1 and 2 of the Periodic Table; and
- (2) Q is the cationic structure directing agent.

3. The method of Claim 2, wherein the molecular sieve has a composition comprising, in terms of mole ratios, the following:

SiO ₂ / Al ₂ O ₃	10 – 300
Q / SiO ₂	0.05 – 0.4
M / SiO ₂	0.01 – 0.3

4. The method of Claim 2, wherein the molecular sieve has a composition comprising, in terms of mole ratios, the following:

SiO ₂ / Al ₂ O ₃	20 – 100
Q / SiO ₂	0.1 – 0.3
M / SiO ₂	0.02 – 0.1

5. The method of Claim 1, wherein the molecular sieve is prepared from a reaction mixture comprising, in terms of mole ratios, the following:

$\text{SiO}_2 / \text{Al}_2\text{O}_3$	20 – 100
M / SiO_2	0.02 – 0.1
Q / SiO_2	0.1 – 0.3
$\text{OH}^- / \text{SiO}_2$	0.2 – 0.4
$\text{H}_2\text{O} / \text{SiO}_2$	15 – 30

wherein:

- (1) M is the at least one element selected from Groups 1 and 2 of the Periodic Table; and
- (2) Q is the cationic structure directing agent.

6. The method of Claim 5, wherein the molecular sieve has a composition comprising, in terms of mole ratios, the following:

$\text{SiO}_2 / \text{Al}_2\text{O}_3$	10 – 300
Q / SiO_2	0.05 – 0.4
M / SiO_2	0.01 – 0.3

7. The method of Claim 5, wherein the molecular sieve has a composition comprising, in terms of mole ratios, the following:

$\text{SiO}_2 / \text{Al}_2\text{O}_3$	20 – 100
Q / SiO_2	0.1 – 0.3
M / SiO_2	0.02 – 0.1

8. The method of Claim 1, wherein the molecular sieve has a composition, as made and in the anhydrous state, comprising, in terms of mole ratios, the following:

$\text{SiO}_2 / \text{Al}_2\text{O}_3$	10 – 300
Q / SiO_2	0.05 – 0.4
M / SiO_2	0.01 – 0.3

wherein:

- (1) M is the at least one element selected from Groups 1 and 2 of the Periodic Table; and
- (2) Q is the cationic structure directing agent.

9. The method of Claim 1, wherein the molecular sieve has a composition comprising, in terms of mole ratios, the following:

SiO ₂ / Al ₂ O ₃	20 – 100
Q / SiO ₂	0.1 – 0.3
M / SiO ₂	0.02 – 0.1

wherein:

- (1) M is the at least one element selected from Groups 1 and 2 of the Periodic Table; and
- (2) Q is the cationic structure directing agent.

10. The method of Claim 1, wherein the reaction mixture further comprises CHA seed crystals.
