

ABSTRACT

A dilution apparatus for water quality measurement for preparing sample water by diluting a raw solution with dilution water, the apparatus comprising: a container 10; a raw solution supply unit for supplying the raw solution to the container; a dilution water supply unit for supplying dilution water to the container 10; a circulation unit for circulating the water in the container; an outflow unit for allowing the water in the container to flow out; and a pressure sensor 9 for detecting a water level in the container, wherein the outflow unit includes a pump 14, and the water is caused to flow out from the container 10 by gravity in a state where the pump 14 is stopped.
