APPLICATION PROGRAMMING INTERFACE ACCESS METHOD AND APPARATUS, STORAGE MEDIUM, AND COMPUTER SYSTEM

ABSTRACT

Embodiments of this specification disclose an application programming interface access method. A first request sent by a target user for a target application programming interface is received, where the first request includes a target user field; a target factor field corresponding to the target user field is determined based on a pre-stored field correspondence, where the field correspondence indicates a correspondence between a factor field provided in the target application programming interface and a user field that matches the target user; and field content of the target factor field is obtained from a serving end corresponding to the target application programming interface based on the target factor field, and the field content of the target factor field is sent to the target user as field content of the target user field. According to this method, different users can access the same application programming interface through user fields defined by themselves, thereby improving user experience of users accessing the application programming interface.
