

ABSTRACT

A liquid leakage treatment facility includes: a containment dike (4) that is capable of retaining leaked liquefied ammonia (X) and that is open upward; a plurality of thermally insulative coated floats (5) that are laid to cover a bottom portion (4a) of the
5 containment dike and that are caused to float by the liquefied ammonia (X) retained in the containment dike (4); and a drainage section (6) configured to deliver the liquefied ammonia (X) retained in the containment dike (4) to an outside of the containment dike (4).
