SIGNAL TRANSMISSION METHOD AND APPARATUS

ABSTRACT

This application provides a method and an apparatus, and may be applied to the communication field. The method includes: A network device may modulate first information by using a first modulation scheme and modulate second information by using a second modulation scheme in a first signal, to modulate the first information and the second information onto the first signal, where the first modulation scheme may be phase shift keying modulation or quadrature amplitude modulation, and the second modulation scheme is amplitude shift keying modulation. The network device sends the first signal on a first time-frequency resource.
