

TWO-DIMENSIONAL CODE GENERATION METHOD, APPARATUS, DATA PROCESSING METHOD, APPARATUS, AND SERVER

ABSTRACT

5 The present specification discloses two-dimensional code generation methods,
apparatuses, data processing methods, apparatuses, and servers. The two-dimensional
code generation method is applied to an electronic device, and a secure element is
disposed in the electronic device. In the two-dimensional code generation method,
two-dimensional code generation data is obtained; signature data is obtained by using
10 a predetermined signature algorithm stored in the secure element; and a target
two-dimensional code is generated based on the two-dimensional code generation
data and the signature data. As such, security of the target two-dimensional code is
ensured.
