

## CIS-IMIDAZOLINES AS MDM2 INHIBITORS

This invention is related to at least one compound selected from a compound of formula I

and the pharmaceutically acceptable salts and esters thereof, wherein  $X_1$ ,  $X_2$ ,  $R_1$  and  $R_2$  are described within this application. This compound is believed to inhibit the interaction of MDM2 protein with a p53-like peptide and have antiproliferative activity

p53 is a tumor suppresser protein that plays a central role in protection against development of cancer. It guards cellular integrity and prevents the propagation of permanently damaged clones of cells by the induction of growth arrest or apoptosis. At the molecular level, p53 is a transcription factor that can activate a panel of genes implicated in the regulation of cell cycle and apoptosis. p53 is a potent cell cycle inhibitor which is tightly regulated by MDM2 at the cellular level. MDM2 and p53 form a feedback control loop. MDM2 can bind p53 and inhibit its ability to transactivate p53-regulated genes. In addition, MDM2 mediates the ubiquitin-dependent degradation of p53. p53 can activate the expression of the MDM2 gene, thus raising the cellular level of MDM2 protein. This feedback control loop insures that both MDM2 and p53 are kept at a low level in normal proliferating cells. MDM2 is also a cofactor for E2F, which plays a central role in cell cycle regulation.

The ratio of MDM2 to p53 (E2F) is dysregulated in many cancers. Frequently occurring molecular defects in the p16INK4/p19ARF locus, for instance, have been shown to affect MDM2 protein degradation. Inhibition of MDM2-p53 interaction in tumor cells with wild-type p53 should lead to accumulation of p53, cell cycle arrest and/or apoptosis. MDM2 antagonists, therefore, can offer a novel approach to cancer therapy as single agents or in combination with a broad spectrum of other antitumor therapies. The feasibility of this strategy has been shown by the use of different macromolecular tools for inhibition of MDM2-p53 interaction (e.g. antibodies, antisense

oligonucleotides, peptides). MDM2 also binds E2F through a conserved binding region as p53 and activates E2F-dependent transcription of cyclin A, suggesting that MDM2 antagonists might have effects in p53 mutant cells.

The compounds of the present invention can be prepared according to the following schemes. The following definitions are provided as applicable to the synthesis schemes:

## Synthesis

The compounds of formula I can be prepared according to the scheme 1.

### Scheme 1

- 5 Many benzonitriles of formula II are commercially available. They are converted to the imidate salts (III) using HCl gas in ethanol. The rate of the reaction depends on the substituents on the phenyl ring. In cases where  $X_1$  or  $X_2 \neq H$ , it may be necessary to run the reaction under pressure of HCl over a longer period of time. Condensation of the imidates (III) with the 1,2-diamines (IV) is carried out in ethanol at 40–100 °C in the  
10 presence or absence of a base such as triethylamine.

If it is desired to prepare the compounds of formula II which are not commercially available, many synthetic methods known in the art can be employed. Suitable processes for synthesizing these benzonitriles are provided in the examples. Following schemes illustrate some of these methods.

- 15 A compound of formula B ( $V^{16}$  can be any suitable group such as  $V^1$ ,  $V^2$ ,  $V^3$ ,  $V^4$ , or  $V^5$ ) can be prepared by alkylation of a compound of formula A with  $V^6X$  ( $X = Cl, Br, I$ ) using conventional methods (scheme V). The phenoxide anion is generated by a base such as cesium carbonate or potassium carbonate. The reaction typically is carried out in refluxing acetone.  $V^6$  can also be introduced using Mitsunobu reaction (see for example,  
20 Hughes, D. L. *Org. React.* **1992**, 42, 335–656).

## Scheme 1a

A compound of formula C ( $\text{V}^{16}$  can be any suitable group such as  $\text{V}^1$ ,  $\text{V}^2$ ,  $\text{V}^3$ ,  $\text{V}^4$ , or  $\text{V}^5$ ) can be converted into the benzonitrile D using literature procedures (Karmarkar, S. N; Kelkar, S. L.; Wadia, M. S. *Synthesis* **1985**, 510–512; Bergeron, R. J. et al. *J. Med. Chem.* **1999**, 42, 95–108). V group can then be introduced using  $\text{V}^6\text{X}$  ( $\text{X} = \text{Cl}, \text{Br}, \text{I}$ ) or Mitsunobu reaction to give the benzonitrile 13 (scheme 1b).

## Scheme 1b

10

A compound of formula F can be prepared by bromination or iodination of phenol E (Scheme VII), ( $\text{V}^{16}$  can be any suitable group such as  $\text{V}^1$ ,  $\text{V}^2$ ,  $\text{V}^3$ ,  $\text{V}^4$ , or  $\text{V}^5$ ). Reaction conditions such as *N*-bromosuccinamide/tetrahydrofuran or iodine/thallium(I) acetate can be utilized (see for example, Carreno, M. C.; Garcia Ruano, J. L.; Sanz, G.; Toledo, M. A.; Urbano, A. *Synlett* **1997**, 1241–1242; Cambie, R. C.; Rutledge, P. S.; Smith-Palmer, T.; Woodgate, P. D. *J. Chem. Soc., Perkin Trans. 1* **1976**, 1161–4).  $\text{V}^5$  group can then be introduced using  $\text{V}^6\text{X}$  ( $\text{X} = \text{Cl}, \text{Br}, \text{I}$ ) or Mitsunobu reaction. Methods of converting aromatic halides to the corresponding nitriles are known in the art (see for example, Okano, T.; Iwahara, M.; Kiji, J., *Synlett* **1998**, 243). Cyanation of the halide ( $\text{X}' = \text{Br}, \text{I}$ ) can be accomplished using zinc cyanide with a catalyst such as tetrakis(triphenylphosphine)palladium (0). Solvents such dimethylformamide can be used and the reaction temperature is between 80–110 C.

20

Scheme 1c

In scheme 1D, amination of aromatic halide G using  $\text{HN}V^7V^8$  and palladium catalyst can be utilized to provide the benzonitrile of formula H (see for example, Harris, M. C.; Geis, O.; Buchwald, S. L. *J. Org. Chem.* **1999**, 64, 6019).

Scheme 1d

A compound of formula D ( $V^{16}$  can be any suitable group such as  $V^1$ ,  $V^2$ ,  $V^3$ ,  $V^4$ , or  $V^5$ ) can be prepared by nucleophilic substitution of 2-halobenzonitrile I (scheme 1e). (see for example, X = F: Wells, K. M.; Shi, Y.-J.; Lynch, J. E.; Humphrey, G. R.; Volante, R. P.; Reider, P. J. *Tetrahedron Lett.* **1996**, 37, 6439–6442; X =  $\text{NO}_2$ : Harrison, C. R.; Lett, R. M.; McCann, S. F.; Shapiro, R.; Stevenson, T. M. WO 92/03421, 1992).

Scheme 1e

To prepare the benzonitrile of formula L wherein  $V^1$ ,  $V^2$ ,  $V^3$ ,  $V^4$ , or  $V^5 = \text{OV}^6$ , sequential alkylation of the diol 19 with suitable  $V^6X$  ( $X = \text{Cl}, \text{Br}, \text{I}$ ) are used. The bromides K are then converted to the nitriles L using zinc cyanide and Pd(0) catalyst (scheme 1f).

Scheme 1f

The 1,2-diamines of formula IV are prepared using procedures as reported by Shatzmiller, S.; Bercovici, S. *Liebigs Ann. Chem.* **1992**, 1005–1009 (Scheme 2). The ketone VI is converted to the corresponding oxime ether.  $\alpha$ -Bromination of the oxime ether with N-bromosuccinimide and reaction of the  $\alpha$ -bromo oxime ether with ammonia in methanol gives the  $\alpha$ -amino oxime ether VII. Reduction of VII with lithium aluminum hydride gives a mixture of cis and trans 1,2-diamine (~4–6:1 ratio of cis:trans). The crude 1,2-diamine is then reacted with compound of formula III to give a mixture of cis and trans products. The desired compound (formula V) can be isolated from the mixture by preparative chromatography techniques.

Scheme 2

15

When  $R_2 = \text{COR}_{11}$ , the compound V is converted to the compound of formula VIII using a compound of formula  $\text{ClCOR}_{11}$  (a known compound or a compound prepared by known methods) in the presence of a base such triethylamine (Scheme 3).

20

Scheme 3

When  $R_2 = \text{CONR}_{12}\text{R}_{13}$ , the compound of formula V is reacted with phosgene at 0 °C in the presence of a base such as triethylamine followed by the treatment of a  
 5 compound of formula  $\text{NHR}_{12}\text{R}_{13}$  (a known compound or a compound prepared by known methods) to give the compound of formula IX (Scheme 4).

Scheme 4

10 The present invention encompasses the following Examples. Structural formulas follow. With regard to structural formulas, it is understood that oxygen and nitrogen atoms with available electrons have a hydrogen bound thereto, as indicated by compound name.

15 The following compounds were tested according to the above-described assay and exhibited  $\text{IC}_{50}$ 's from about 0.5  $\mu\text{M}$  to about 300  $\mu\text{M}$ .

Example 1

Ethyl 2-ethoxy-4-methoxy-benzimidate hydrochloride

A mixture of the 2-hydroxy-4-methoxybenzaldehyde (20 g, 128.8 mmol), sodium acetate (35.05 g, 257.6 mmol) and nitroethane (19 mL, 257.6 mmol) in glacial acetic acid (100 mL) was heated at gentle reflux for 12 h. The reaction mixture was then poured into ~1000 mL of ice water (1:1 ratio of ice and water). The product was  
5 extracted with ethyl acetate (3 x 200 mL). The organic extracts were washed with sodium bicarbonate solution until the aqueous layer had pH ~8. The organic layers were then dried over anhydrous magnesium sulfate and concentrated *in vacuo* to afford 2-hydroxy-4-methoxy-benzonitrile as a yellow oil (16.5 g, 86%). It was used without further purification.

10 To a solution of 2-hydroxy-4-methoxy-benzonitrile (9.637 g, 64.61 mmol) in ethanol (50 mL) were added potassium carbonate (17.88 g, 129.2 mmol) and iodoethane (15.7 mL, 193.8 mmol). The reaction mixture was heated at gentle reflux for 12 h. The solvent was removed to afford a yellow-brown paste. It was then taken in diethyl ether (50 mL) and water (20 mL). The layers were separated and the aqueous layer was  
15 extracted with diethyl ether (2 x 150 mL). The combined organic extracts were washed with water (1 x 20 mL), brine (1 x 20 mL), and dried over anhydrous sodium sulfate. The solids were then filtered off, and the filtrate was concentrated *in vacuo*. Purification of the crude residue by flash chromatography (Biotage system, KP-Sil™ 32–63 µm, 60 Å silica gel) eluting with 10–15% ethyl acetate in hexanes yielded 2-ethoxy-4-methoxy-  
20 benzonitrile as yellow solids (9.487 g, 83%).

Hydrogen chloride gas was passed through a solution of 2-ethoxy-4-methoxy-benzonitrile (6.3 g, 35.55 mmol) in anhydrous ethanol (70 mL) cooled to -10 °C. After 30 min, hydrogen chloride gas was stopped and the reaction mixture was stirred at room temperature in a closed reaction vessel for 4 d. The reaction vessel was cooled to 0 °C  
25 before the stopper was removed. Argon gas was passed through the solution to remove excess hydrogen chloride gas. The solvent was evaporated and the residue was triturated in diethyl ether (100 mL) to afford ethyl 2-ethoxy-4-methoxy-benzimidate hydrochloride (7.3 g, 79%). It was used without further purification.

(b) Ethyl 2-(2-fluoro-ethoxy)-4-methoxy-benzimidate hydrochloride from 2-hydroxy-4-methoxy-benzonitrile and 1-bromo-2-fluoro-ethane.

5 (c) Ethyl 2,4-diethoxy-benzimidate hydrochloride from 2,4-diethoxy-benzaldehyde.

### Example 3

10 1-(4-Chloro-phenyl)-3-cyclopentyl-propan-1-one

Aluminum chloride (4.979 g, 37.34 mmol) was added in small portions to a solution of 3-cyclopentylpropionyl chloride (3 g, 18.67 mmol) in 1,2-dichloroethane (100 mL) cooled to 0 °C. After 15 min., chlorobenzene (6.304 g, 56.01 mmol) was added. The reaction mixture was stirred at 0 °C for 1 h and at room temperature for 48 h. It was then poured into a mixture of ice and water. The product was extracted with ethyl acetate. The organic layers were washed with saturated solution of sodium

bicarbonate (1 x 30 mL), brine (1 x 20 mL) and dried over anhydrous magnesium sulfate. The solids were then filtered off, and the filtrate was concentrated *in vacuo*. Purification of the crude residue by flash chromatography (Biotage system, KP-Sil™ 32–63 μm, 60 Å silica gel) eluting with hexanes yielded 1-(4-chloro-phenyl)-3-cyclopentyl-propan-1-one (1.12 g, 25%) as yellow oil.

To a solution of 1-(4-chloro-phenyl)-3-cyclopentyl-propan-1-one (1.12 g, 4.731 mmol) in ethanol (15 mL) was added potassium carbonate (1.962 g, 14.19 mmol) and methoxyamine hydrochloride (494 mg, 5.914 mmol). The reaction mixture was heated at reflux for 12 h. Upon cooling to room temperature, the reaction mixture was filtered, and the white solids were washed with diethyl ether. The filtrate was concentrated *in vacuo*, and the residue was partitioned between diethyl ether and water. The product was extracted with diethyl ether (2 x 30 mL). The organic layers were washed with brine and dried over anhydrous sodium sulfate. The solids were then filtered off, and the filtrate was concentrated *in vacuo*. Purification of the crude residue by flash chromatography (Biotage system, KP-Sil™ 32–63 μm, 60 Å silica gel) eluting with 1–2% ethyl acetate in hexanes yielded 1-(4-chloro-phenyl)-3-cyclopentyl-propan-1-one O-methyl-oxime (762 mg, 61%) as clear oil.

#### 2-Bromo-1-(4-chloro-phenyl)-3-cyclopentyl-propan-1-one O-methyl-oxime

To a solution of 1-(4-chloro-phenyl)-3-cyclopentyl-propan-1-one O-methyl-oxime (1.120 g, 4.214 mmol) in carbon tetrachloride were added N-bromosuccinimide (812 mg, 4.425 mmol) and benzoyl peroxide (102 mg, 0.4 mmol). The resulting mixture was heated at reflux for 12 h. Upon cooling to room temperature, the solids were filtered and

washed with diethyl ether. The filtrate was washed with aqueous solution of sodium bicarbonate, sodium thiosulfate and brine. It was then dried with anhydrous sodium sulfate and concentrated *in vacuo*. Purification of the crude residue by flash chromatography (Biotage system, KP-Sil™ 32–63  $\mu$ m, 60 Å silica gel) eluting with 1–  
5 2% ethyl acetate in hexanes yielded 2-bromo-1-(4-chloro-phenyl)-3-cyclopentyl-propan-1-one O-methyl-oxime (1.16 g, 80%) as yellow oil.

#### Example 6

10 2-Amino-1-(4-chloro-phenyl)-3-cyclopentyl-propan-1-one O-methyl-oxime

The 2-bromo-1-(4-chloro-phenyl)-3-cyclopentyl-propan-1-one O-methyl-oxime (1.16 g, 2.901 mmol) was dissolved in a solution of ammonia in methanol (30 mL, ~7 N). The reaction flask was sealed with a Teflon stopper, and the reaction mixture was stirred at 55–60 °C for 2 d. It was cooled to 0 °C then the stopper was removed. The  
15 reaction mixture was concentrated to remove ammonia and methanol. The residue was partitioned between water and diethyl ether. The product was extracted with diethyl ether (2 x 20 mL). The organic layers were washed with brine, dried over anhydrous sodium sulfate and concentrated *in vacuo*. Purification of the crude residue by flash chromatography (Biotage system, KP-Sil™ 32–63  $\mu$ m, 60 Å silica gel) eluting with 50–  
20 100% ethyl acetate + 0.1% triethylamine in hexanes yielded 2-amino-1-(4-chloro-phenyl)-3-cyclopentyl-propan-1-one O-methyl-oxime (423 mg, 45%) as yellow oil.

A solution of 2-amino-1-(4-chloro-phenyl)-3-cyclopentyl-propan-1-one O-methyl-oxime (420 mg, 1.567 mmol) in diethyl ether (3 mL) was added dropwise to a slurry mixture of lithium aluminumhydride (307 mg, 7.835 mmol) in diethyl ether (30 mL) cooled to 0 °C. At the end of addition, the icebath was removed and the reaction was

stirred at room temperature for 3 h. The reaction mixture was cooled to 0 °C and aqueous solution of sodium chloride was added to quench the excess lithium aluminumhydride. Sodium hydroxide solution was added and the biphasic mixture was stirred for 1 h. The product was extracted with diethyl ether (3 x 30 mL). The ethereal  
5 extracts were washed with brine and dried over anhydrous sodium sulfate. Evaporation of the solvent gave 1-(4-chloro-phenyl)-3-cyclopentyl-propane-1,2-diamine as yellow oil (362.7 mg, 96%, 4.3:1.0 ratio of cis:trans). The crude product was used without further purification.

Example 60In Vitro Activity Assay

The ability of the compounds to inhibit the interaction between p53 and MDM2

15 proteins was measured by an ELISA (Enzyme-Linked Immuno Sorbent Assay) in which recombinant GST-tagged MDM2 binds to a peptide that resembles the MDM2-interacting region of p53 (Böttger et al., J. Mol. Bio. 1997, Vol. 269, pgs. 744-756). This peptide was immobilized to the surface of a 96 well plate via N-terminal biotin which binds to streptavidin-coated wells. MDM2 was added to each well in the presence of

20 anti-MDM2 mouse monoclonal antibody (SMP-14, Santa Cruz Biotech). After removal of the unbound MDM2 protein, a peroxidase-linked secondary antibody (anti-mouse IgG, Roche Molecular Biochemicals) and the amount of peptide-bound MDM2 was determined colorimetrically by the addition of a peroxidase substrate (MTB Microwell Peroxidase Substrate System, Kirkegaard & Perry Labs).

25 Test plates were prepared by coating with streptavidin (5 mg/ml in PBS) for 2 hours followed by a PBS (phosphate-buffered saline) wash and overnight blocking with 150  $\mu$ l of blocking buffer containing 2 mg/ml bovine serum albumin (Sigma) and 0.05% Tween 20 (Sigma) in PBS at 4°C. Biotinylated peptide (1  $\mu$ M) was added to each well in

50  $\mu$ l of blocking buffer and washed extensively after 1 h incubation. Test compounds were diluted in a separate 96 well plate and added in triplicate to a compound incubation plate containing a mix of the MDM2 protein and anti-MDM2 antibody. After 20 min incubation, the content of the plate was transferred to the test plate and incubated for an additional 1 hour. The secondary anti-mouse IgG antibody was added to the test plate proceeded and followed by a triple wash with 0.05% Tween 20 in PBS. Finally, peroxydase substrate was added to each well and the absorption was read using a plate reader (MR7000, Dynatech) at 450nm. The inhibitory activity of the test compounds was measured as a percentage of the bound MDM2 in treated vs. untreated wells and IC<sub>50</sub> was calculated.

IC<sub>50</sub>s showing biological activity that applies to compounds of the subject matter of this invention ranges from about 0.5  $\mu$ M to about 150  $\mu$ M. Specific data for some examples are as follows:

| Example | IC <sub>50</sub> ( $\mu$ M) |
|---------|-----------------------------|
| 26      | 45.0                        |
| 24      | 13.2                        |
| 28      | 5.5                         |
| 55      | 0.7                         |
