

A VERSATILE PACKAGING BOX FOR PRODUCTS

FIELD OF THE INVENTION

The present invention is generally related to packaging boxes, and more particularly to versatile packaging boxes including those for cigarette, wine, tea and moon cake incorporating a special compartment for books.

BACKGROUND OF THE INVENTION

The current packaging boxes available in the market, as up-scale as they can, have a simple structure and little functionality except for holding the items contained therein. The used packing boxes will be disposed other than retained for further use, which is a waste of resources and an adverse impact on the environment.

Referring to Fig. 9, there is illustrated a new type of wine packaging box that after the product 3 and the book 5 are removed, the box 4 will be disposed. Slot-type compartments are provided on its inner walls to hold drunkenness relieving tea, drinking game cards, booklets or brochures. However, once the items contained are removed, the packaging box becomes useless.

There continues to be a need to convert the packaging box into the cover of complimentary book to create an integration of product package and the book introducing the product culture, so as to utilize the resources efficiently while preventing pollution. In addition, it can build up the cultural taste of the product.

SUMMARY OF THE INVENTION

The present invention is intended to provide a versatile packaging box that can be folded into the cover of the complimentary book after the product is removed to create an integration of product package and the book introducing the product culture and enable efficient use of packaging materials and less waste. The present invention is a normal packaging box when holding the product inside it and, after the product is removed, can be converted into the cover of the complimentary book.

The purpose of the present invention is achieved as follows: it is a versatile packaging box in a rectangular form, intended for holding the product and the complimentary book, with the back

cover of the book attached to the bottom of the box. A versatile packaging box for products, which can be folded into a book cover or an envelope for the contained book, is disclosed. On its front, rear, left and right vertical panels, a folding line whose position is adapted to the thickness of the contained book is respectively provided. The front, rear, left and right vertical panels are provided with foldable end panels. The height of remaining part of the left vertical panel and the length of end panel add up to the length of the front cover of said book, and so is the sum of the height of remaining part of the right vertical panel and the length of end panel. When the end panel is folded onto the inner side of the rear vertical panel, the height of remaining part of the rear vertical panel is equal to the width of the front cover of said book. When the end panel is folded onto the inner side of the front vertical panel, the height of remaining part of the front vertical panel is also equal to the width of the front cover of said book.

A fastening device is provided at the end panel of the said packaging box finally converted into a book cover.

Detachable fastening device provided between the left and right vertical panels and the bottom surface of said packaging box can be nylon buckle or double-sided adhesive tape, etc. When converted into a book cover, the height of rest part of the front and rear panels is equal to the width of the front cover of said book. The end panels are folded onto the inner side of the front and rear panels respectively, and the left and right panels can be removed.

When the said packaging box is used as a book cover, the rest part of said front and rear vertical panels and the end panels, after folding, encase the upper cover of the book with its total length equal to the total width of the book; the rest part of said left and right vertical panels and the end panels, after folding, create a lining for the upper cover of the book with its total length equal to the total length of the book.

Detachable fastening device provided between the left and right vertical panels and the bottom surface of said packaging box can be nylon buckle or double-sided adhesive tape, etc.

The front, rear, left and right vertical panels of said packaging box are provided with foldable end panels. The upper and lower end panels join each other to form top surface and bottom

surface respectively. A vertical folding line is provided in the left vertical panel and the distance between such line and the front vertical panel is equal to the thickness of said book. A vertical folding line is provided in the right vertical panel and the distance between such line and the back vertical panel is equal to the thickness of said book. The said front, rear, left and right vertical panels are provided with foldable end panels. The upper and lower end panels join each other to form top surface and bottom surface respectively. A vertical folding line is provided in the left vertical panel and the distance between such line and the front vertical panel is equal to the thickness of said book. A vertical folding line is provided in the right vertical panel and the distance between such line and the back vertical panel is equal to the thickness of said book.

A fastening device is provided between the front vertical panel and the right vertical panel of the said packaging box. The outer surface of the fastener can be attached and detached from the inner side of the front vertical panel.

The present invention facilitate the efficient use of the storage space inside the packing box by holding the book introducing Chinese wine culture inside it while using the product package as a book cover. There is no need for disposal of the used product package and what's more, the cultural image of the product is enhanced. Therefore, it is a solution for saving resources, preventing pollution, popularizing corporate and regional culture, and building recognition.

The following is a detailed description of the present invention based on the attached drawings. For convenience, the following terms, when mentioned herein, shall have the following meanings. Front vertical panel refers to the side of packaging box in front of the observer. Left vertical panel refers to the side of packaging box on the left side of the observer. Right vertical panel refers to the side of packaging box on the right side of the observer. Rear vertical panel refers to the forth side. Same numbers used in these drawings refer to identical or similar components.

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

Referring to Fig. 5 and Fig. 6, Fig. 5 is a perspective view of an embodiment of packing box and Fig. 6 is a perspective view of a book envelope converted from the embodiment of packing box illustrated in Fig. 5. Fig. 5 illustrates a packaging box in rectangular form intended for holding the product and the complimentary book 7. The back cover of the book is attached to the bottom 6 (not marked). Folding lines 13, 23, 33 and 43, adapted to the thickness of the book contained, are provided on the front panel 1, rear panel 2, left panel 3 and right panel 4; and end panels 14, 24, 33 and 34 are provided on the front, rear, left and right vertical panels. Referring to Fig. 6, when the product is removed, the left panel 3 is folded along the folding line 33 towards the book 7. The height of remaining part of the left panel 3 and the length of end panel 34, when covering the upper cover of book 7, add up to the length of the front cover of book 7. Then, the rear panel 2 is folded along the folding line 23 towards the book 7. The height of remaining part of the rear panel is equal to the width of the front cover of said book and the end panel is folded onto the inner side of panel 2. Place the rest part of rear vertical panel onto

the left vertical panel 3 on the upper cover of book 7, and then fold the right panel 4 along the folding line 43 towards the book 7. The height of remaining part of the right panel 4 and the length of end panel 44, when covering the rear panel 2 on the upper cover of book 7, add up to the length of the front cover of the book 7. Then, the front panel 1 is folded along the folding line 13 towards the right panel 4 already folded onto the book 7 with the height of rest part of the front panel equal to the width of the front cover of said book 7, and the end panel 14 folded onto the inner side of the said panel 1. In this way, the packaging box is converted into the book cover of book 7. In view of the board thickness, the distance between the folding line and the bottom surface can be properly increased according to the folding procedure.

A fastening device is provided at the remained end panel of the said packaging box that is converted into a book cover. Detachable fastening device can be nylon buckle or double-sided adhesive tape, etc.

Fig. 7 illustrates the remaining part of an embodiment when the items contained are removed. Detachable fastening device provided between the left panel 3 and right panel 4 and the bottom surface of said packaging box can be nylon buckle or double-sided adhesive tape, etc. To create a book cover, the rest part of front panel 1 and rear panel 2 above the folding line have a height equal to the width of front cover of said book and the end panels are folded onto the inner side of said front and rear panels respectively. The said left and right panels can be removed, so that the said front and rear panels can be folded towards the said book in turn to form the envelope of book 7. Otherwise, insert the left and right panels and the end panels in turn can be inserted into the inner side of back cover of book 7 to form the cover of book 7.

Fig. 8 illustrates an embodiment of unfolded packaging box. By folding left panel 3, right panel 4, rear panel 2 and front panel 1 towards the book 7 in turn and, after folding, the rest part of front panel 1 and rear panel 2 and the end panels 14 and 24 encase the upper cover of the book 7 with its total length adapted to the total width of the book; the rest part of left panel 3 and right panel 4 and the end panels 33 and 34, create a lining for the upper cover of the book with its total length equal to the total length of the book.

Referring to Fig. 1 and Fig. 2, end panels are provided at the top and bottom of front panel 1, rear panel 2, left panel 3 and right panel 4 of said packaging box. These end panels join each

other to form top surface 5 (not shown) and bottom surface 6 (not shown) respectively. A vertical folding line 33 is provided in said left panel 3 and the distance between such line and the front panel 1 is equal to the thickness of said book. A vertical folding line 43 is provided in the right panel 4 and the distance between such line and the back panel 2 is equal to the thickness of said book. During packaging, the product and the book (in roll) are placed in the packaging box. After the product is removed, first fold the end panels to the inner side of each panel and then change the shape of packaging box into the one illustrated in Fig. 2 by pressing along the folding lines 33 and 43. The front panel 1 and the rest part of left panel form the rear part of book envelope of the book 7. In this way, the packaging box is converted into the book envelope of the unrolled book.

Referring to Fig. 3 and Fig. 4, Fig. 3 illustrates the book 7 folded and placed in the packaging box and Fig. 4 illustrates the book 7 unfolded. A fastening device B is provided between the front panel and the right panel. The outer surface the fastening device B can be attached and detached from the inner side of the front panel by means of nylon buckle or double-sided adhesive tape. This embodiment is similar to the one illustrated in Fig. 1 and Fig. 2 except for the fastening device B. After the product is removed, the fastening device B is detached and the packaging box is pressed along folding lines 33 and 43, fold the front panel 1 and the upper and lower end panels of right panel towards the inner side of front cover of book 7 to form the front book cover, and then fold the rear panel 2 and the upper and lower end panels of left panel towards the inner side of back cover of book 7 to form the rear book cover. In this way, the packaging box is converted into the book cover of book 7.

INDUSTRIAL APPLICABILITY

In view of the need that the size of packaging box should be adapted to that of product and book contained, the matching between panels and end panels and the position of folding lines should be determined by the designer according to the actual situations and therefore not addressed herein. The present invention has a number of advantages. There is no need for disposal of the used product package and what's more, the cultural image of the product is enhanced. Therefore, it is a solution for saving resources, preventing pollution, creating publicity, introducing Chinese culture and build recognition.

Amended Claims according to Article 19 of PCT

1. A versatile packaging box in a rectangular form, intended for holding a product and a complimentary book (7) with the back cover of the book (7) attached to the bottom of box (6), wherein, on its front, rear, left and right vertical panels (1, 2, 3, 4), the folding lines (13, 23, 33, 43) whose position are adapted to the thickness of the contained book (7) are respectively provided; the front, rear, left and right vertical panels (1, 2, 3, 4) are provided with foldable end panels (14, 24, 34, 44); the height of rest part of the left vertical panel (3) and the length of end panel (34) add up to the length of the front cover of said book (7), and so is the sum of the height of rest part of the right vertical panel (4) and the length of end panel (44); when the end panel (24) is folded onto the inner side of the rear vertical panel (2), the height of rest part of the rear vertical panel (2) is equal to the width of the front cover of said book (7); when the end panel (14) is folded onto the inner side of the front vertical panel (1), the height of rest part of the front vertical panel (1) is also equal to the width of the front cover of said book (7).

2. A versatile packaging box as claimed in Claim 1, wherein, detachable fastening device between the said left and right vertical panels (3, 4) and the bottom surface is in the form of nylon buckle or double-sided adhesive tape, etc; to create a book cover of the said book (7), the rest part of front and rear panels (1, 2) have a height equal to the width of front cover of said book (7) and the end panels(14, 24) are folded onto the inner side of said front and rear panels (1, 2) respectively; the left and right panels (3, 4) can be removed.

3. A versatile packaging box as claimed in Claim 1, wherein, the packaging box can be folded in the way that the rest part of the front and rear panels (1, 2) and the end panels(14, 24) jointly encase the upper cover of the book with its total length adapted to the total width of the book; the rest part of left and right panels (3, 4) and the end panels (34, 44) jointly create a lining for the upper cover of the book with its total length adapted to the total length of the book.

4. A versatile packaging box as claimed in Claim 1, wherein, foldable end panels (14, 24, 34, 44) are provided on the front, rear, left and right panels (1, 2, 3, 4), among which the upper and lower end panels join each other to form top surface and bottom surface respectively; a folding line (33) is provided in the left vertical panel (3) and the distance between such line and the

front vertical panel (1) is equal to the thickness of said book (7); a folding line (43) is provided in the right vertical panel (4) and the distance between such line and the back vertical panel (2) is equal to the thickness of said book (7).

5. A versatile packaging box as claimed in Claim 4, wherein a fastening device B whose outer surface can be attached and detached from the inner side of the front vertical panel is between the front panel (1) and the right panel (4).

6. A versatile packaging box as claimed in Claim 1, wherein, a fastening device is provided at the end panel of the said packaging box finally converted into a book cover.

ABSTRACT

A versatile packaging box for products, which can be folded into a book cover or an envelope for the contained book, is disclosed. On its front, rear, left and right vertical panels, a folding line whose position is adapted to the thickness of the contained book is respectively provided. The front, rear, left and right vertical panels are provided with foldable end panels. The height of rest part of the left vertical panel and the length of end panel add up to the length of the front cover of said book, and so is the sum of the height of rest part of the right vertical panel and the length of end panel. When the end panel is folded onto the inner side of the rear vertical panel, the height of rest part of the rear vertical panel is equal to the width of the front cover of said book. When the end panel is folded onto the inner side of the front vertical panel, the height of rest part of the front vertical panel is also equal to the width of the front cover of said book. Said box has the advantages as follows: making full use of the used packaging box, beautifying and protecting the contained book, and reducing the wastes.
