

Abstract

Device for activating and deactivating a safety gear in a lift cage during assembly of a lift installation, wherein the device comprises an actuating element 1, 1' provided for the purpose of being attached to a cage 30, wherein the actuating element 1, 1' in a first position P1 acts on the safety gear 40 in such a way that the safety gear is activated and wherein the actuating element 1, 1' when actuated can be brought by an engineer into a second position P2 in which it does not exert any action on the safety gear 40.
