

ACCESS METHOD AND APPARATUS

ABSTRACT

Embodiments of this application disclose an access method and an apparatus. The method includes: A network device sends, in a first cell, information that indicates characteristic
5 information of terminals allowed to access the first cell. A terminal determines, based on the indication of the information, whether to access the first cell. Alternatively, the terminal reports, in the first cell, characteristic information of the terminal to the network device, and the network device determines, based on the characteristic information reported by the terminal, whether to
10 allow the terminal to access the first cell. The solutions of this application may be widely applied to the fields of communication technologies, artificial intelligence, internet of vehicles, internet of smart home, and the like.
