ABSTRACT

A method for information indication, performed by a network device, includes: sending an indication to a user equipment (UE), the indication indicating the UE not to perform a cell search under a given time condition. Another method for information indication, performed by a UE, includes: receiving an indication sent by a network device, and determining not to perform a cell search under a prescribed time condition.~~The present disclosure relates to an information indication method and apparatus, and a network device, a user equipment (UE) and a storage medium. The information indication method comprises: sending indication information to a UE, wherein the indication information is used for indicating that the UE does not perform cell searching under a given time condition. According to the present disclosure, a paging message monitoring means is determined according to a network device, and it is not necessary to perform paging message monitoring within an indicated time period, thereby realizing a better power saving effect.~~
