

Abstract

The invention can resolve a major problem when trainer is teaching using a white board/flat panel display. The trainer back will be facing the learning as he/she write or read off from the board or display. With this invention, trainer can see clearly learner reaction/responses; enabling her to adjust his/her teaching material accordingly.

The projector glass can be converted to a white board. This is done using the light from the projector. Image (including PowerPoint slides) maybe projected onto the translucent glass for easy viewing for the trainer. You can write over the projected image too by simply writing on the projector glass with a white board marker. Interaction between the image on the projector glass and the laptop/computer maybe achieve using an interactive projector.

Refer to Figure 1 for the schematic diagram of the operation of the invention.
