DISK PLAYBACK DEVICE

ABSTRACT

A disk playback device (1) has at least one endless drive belt (31, 32) stretched along a direction of disk transport between a store position, a playback position and an eject position. The endless drive belt (31, 32) is translated in a direction perpendicular to the direction of disk transport along a plane parallel to the disk (3, 4, 5), allowing the drive belt (31,32) to move away from the disk rim without requiring a large space parallel to the disk.
