(54) **Title:** PROCESSING METHOD, APPARATUS, DEVICE, AND STORAGE MEDIUM

(54) 发明名称: 一种处理方法、装置、设备及存储介质

响应于终端的底层接收到用于调度第一信道的第二信道, 且第一信道的占用资源超出终端的第一信道基带带宽, 底层不向终端的高层通知已接收到第二信道, 或者, 底层向高层执行第一操作

201

图 2

201 In response to a lower layer of a terminal receiving a second channel for scheduling a first channel, and a resource occupied by the first channel exceeding a first channel baseband bandwidth of the terminal, the lower layer does not inform a higher layer of the terminal that the second channel has been received, or the lower layer performs a first operation for the higher layer

(57) **Abstract:** The present disclosure provides a processing method, an apparatus, a device, and a storage medium. The method comprises: in response to a lower layer of a terminal receiving a second channel for scheduling a first channel, and a resource occupied by the first channel exceeding a first channel baseband bandwidth of the terminal, the lower layer does not inform a higher layer of the terminal that the second channel has been received, or the lower layer performs a first operation for the higher layer, wherein the first operation comprises at least one of the following: informing that the second channel has been received, and informing that the reception of the second channel is an invalid reception. For such scenario "when the terminal determines that a resource occupied by the first channel exceeds a first channel baseband bandwidth of the terminal", the present disclosure provides a method for interaction between a lower layer and a higher layer of a terminal, so that the higher layer of the terminal determines whether the terminal has a contention resolution failure, thereby clearly defining an execution procedure of a random access process, and ensuring stability of random access.

(57) 摘要: 本公开提出一种处理方法、装置、设备及存储介质, 方法包括: 响应于所述终端的底层接收到用于调度第一信道的第二信道, 且所述第一信道的占用资源超出所述终端的第一信道基带带宽, 所述底层不向所述终端的高层通知已接收到所述第二信道, 或者, 所述底层向所述高层执行第一操作, 所述第一操作包括以下至少之一: 通知已接收到所述第二信道、通知所述第二信道的接收为无效接收。本公开对于"当终端确定第一信道的占用资源超出终端的第一信道基带带宽"的这一场景, 提出了一种终端的底层和高层的交互方法, 以使得该终端的高层来确定该终端是否竞争解决失败, 从而明确了随机接入过程的执行流程, 确保了随机接入的稳定性。
