

The floating body structure includes: a floating body (2) floating on or under water and supporting an upper structure (10) constructed on an upper part; a load distribution band (3) provided integrally on the floating body (2) and arranged in a grating wall like form; an anchor block (4) provided in an opening region (32) surrounded by the distribution band (3) so as to be detachable and attachable in a state of restricting a movement upward, and in which an anchor reinforcement bar (41) is arranged on an upper end (4a) of the anchor block (4); and a plurality of support column (5) installed on an intersection point of a grating of the load distribution band (3), and configured to form a flexible pit (6) on an upper layer of the load distribution band (3). The foundation (11) of the upper structure (10) is installed on the load distribution band (3), and only the anchor reinforcement bar (41) is integrated and fixed to the foundation (11) with a stable fixation length in which the anchor reinforcement bar obtains predetermined strength.
