

ABSTRACT

[Problem] To provide a transfer apparatus capable of reliably preventing a moving unit from inadvertently rushing out.

[Solving Means] A transfer apparatus that includes a moving unit 42 capable of moving with respect to a base 41 and transferring an article with the moving unit 42 protruding from the base 41. The transfer apparatus includes a movement regulation unit 43 capable of switching between a first state in which the moving unit 42 is restricted in a reference position and a second state in which the moving unit 42 is allowed to move from the reference position to one of a first direction and a second direction opposite to the first direction and in which movement of the moving unit 42 in the other direction is restricted.
