

ABSTRACT

This video monitoring support apparatus is provided with a processor and a storage device coupled to the processor. The storage device holds multiple images. The video monitoring support apparatus performs a similar
5 image search, in which multiple images held in the storage device are searched for images similar to an image extracted from inputted video, outputs multiple recognition results, which include information relating to each of the images obtained by the similar image search, and controls the amount of the outputted recognition results to a predetermined value or less.
