

ABSTRACT

The present invention discloses an information processing system comprising: an information processing server, an information transmitting server, a weather-chart charting server and a nautical-chart-and-sailing-information processing server. The information transmitting server is connected to the information processing server. The weather-chart charting server is connected to the information processing server to receive the weather information and chart the weather information into a weather chart. The nautical-chart-and-sailing-information processing server is connected to the information transmitting server and the weather-chart charting server. The information transmitting server transmits ship-sailing-real-time-monitoring information, geography information and a monitoring information alert to the nautical-chart-and-sailing-information processing server to display on a management overview screen, and the weather-chart charting server transmits a weather chart to the nautical-chart-and-sailing-information processing server to display on the management overview screen.
