

(PYRIDIN-2-YL)AMINE DERIVATIVES AS TGF-BETA R1 (ALK5) INHIBITORS FOR THE TREATMENT OF CANCER

Field of the Invention

[0001] The field of this invention is compounds, pharmaceutical compositions and methods, especially as they are related to compositions and methods for the treatment of a cell proliferation disorder such as fibrosis or cancer, particularly in tissues and organs where the compounds of the invention tend to accumulate in relatively high concentrations due to their pharmacokinetic properties.

Background of the Invention

[0002] The present invention relates to novel aryloxypyridinyl compounds having an acidic moiety, which inhibit activity of transforming growth factor beta receptor 1 (TGF β R1), and tend, due to the acidic moiety, to have limited systemic distribution and thus limit exposure of off-target tissues to the inhibitor. The compounds are most useful to treat conditions such as cancer and fibrosis that occur in the digestive tract and in the first-pass metabolism tissues (liver, kidneys). The invention provides pharmaceutical compositions comprising the compounds, and methods of using the compounds to treat cancer, preferably colon cancer, hepatocellular carcinoma (HCC), renal cancer, pancreatic cancer, myelodysplastic syndrome (MDS), and gastric cancer, and/or fibrosis, preferably liver fibrosis and chronic kidney disease.

[0003] Transforming growth factor beta (TGF-beta or TGF β) is a multi-functional cytokine which binds to the heteromeric complexes of TGF-beta type I and type II serine/threonine kinase receptors and activates the TGF-beta receptor complex, which phosphorylates and activates SMAD2 and SMAD3, which then associate with SMAD4 and migrate into the nucleus and regulate expression of different target genes. Key players of TGF-beta receptor signal transduction pathway include TGF β 1, TGF β 2, TGF β 3, TGF β R1, TGF β R2, SMADs, SnoN, SARA, SKI, DAB, TRAP, TAKI, SMIF, E2F4, E2F5, RBL1, RBL2, RBL, TFDPI, TFDP2, SMURF1, SMURF2, P300, CBP, and JUN. The SMAD mediated TGF-beta receptor pathway regulates various cellular and Signaling via the TGF pathway has been associated with cancer and tumor progression in several indications (Elliott et. al. (2005) J Clin Oncol 23:2078; Levy

et. al. (2006) Cytokine & Growth Factor Rev 17:41-58). There are several types of cancer where TGF ligands produced by the tumor or by the stroma in the tumor microenvironment may participate in tumor progression.

[0004] TGF- β 1 has been associated with angiogenesis, metastasis and poor prognosis in human prostate and advanced gastric cancer (Wikstrom, P., et al. (1998) Prostate 37: 19-29; Saito, H. et al. (1999) Cancer 86: 1455-1462). In breast cancer, poor prognosis is associated with elevated TGF- β (Dickson, et al. (1987) Proc. Natl. Acad. Sci. USA 84:837-841; Kasid, et al. (1987) Cancer Res. 47:5733-5738; Daly, et al. (1990) J. Cell Biochem. 43:199-211; Barrett-Lee, et al. (1990) Br. J Cancer 61:612-617; King, et al. (1989) J. Steroid Biochem. 34:133-138; Welch, et al. (1990) Proc. Natl. Acad. Sci. USA 87:7678-7682; Walker, et al. (1992) Eur. J. Cancer 238:641-644) and induction of TGF- β 1 by tamoxifen treatment (Butta, et al. (1992) Cancer Res. 52:4261- 4264) has been associated with failure of tamoxifen treatment for breast cancer (Thompson, et al. (1991) Br. J. Cancer 63:609-614). Anti TGF β 1 antibodies inhibit the growth of MDA-231 human breast cancer cells in athymic mice (Arteaga, et al. (1993) J. Clin. Invest. 92:2569- 2576), a treatment which is correlated with an increase in spleen natural killer cell activity. CHO cells transfected with latent TGF β 1 also showed decreased NK activity and increased tumor growth in nude mice (Wallick, et al. (1990) J. Exp. Med. 172:1777- 1784). Thus, TGF- β secreted by breast tumors may cause an endocrine immune suppression. High plasma concentrations of TGF β 1 have been shown to indicate poor prognosis for advanced breast cancer patients (Anscher, et al. (1993) N. Engl. J. Med. 328:1592-1598). Patients with high circulating TGF before high dose chemotherapy and autologous bone marrow transplantation are at high risk for hepatic veno-occlusive disease (15-50% of all patients with a mortality rate up to 50%) and idiopathic interstitial pneumonitis (40-60% of all patients). The implication of these findings is 1) that elevated plasma levels of TGF β can be used to identify at risk patients and 2) that reduction of TGF β signaling could decrease the morbidity and mortality of these common treatments for breast cancer patients.

[0005] Recent publications have also suggested that TGF β signaling may be important in driving resistance of tumors to standard of care therapies, including chemotherapies and receptor tyrosine kinases (WO2012138783). Specifically, in colon cancer, a specific gene expression signature has been shown to isolate a group of patients who are resistant to common first line

treatments. These tumor cells regain sensitivity to therapy when the TGF β pathway is blocked with a TGF β RI specific small molecule inhibitor (Huang, et. al. (2012) Cell 151:937-950; Sadanandam et. al. (2013) Nat Med 19:619-625; Vermeulen et.al. (2013) Nat Med 19:614-618; Roepman et. al. (2014) 134:552-562).

[0006] Myelodysplastic syndromes (MDS) are disorders of the hematopoietic system in the myeloid compartment and are characterized by ineffective production of myeloid cells. MDS is linked to alterations of the TGF β pathway represented by reduced SMAD7 levels. SMAD7 is an inhibitory SMAD which functions to inhibit TGF β mediated SMAD signaling and is downstream of ligand activated signaling through TGF β RI and TGF β RII. Overexpression of SMAD7 is thus thought to lead to over-activation of TGF β signaling in MDS, and this phenotype can be reversed by treating with a TGF β RI small molecule inhibitor (Zhou et. al. (2011) Cancer Res. 71:955-963). Similarly, in glioblastoma (GBM), TGF β ligand levels are elevated and related to disease progression. An antisense oligonucleotide therapeutic, AP1002, has been shown to be potentially active in a subset of GBM patients (Bogdahn et. al. (2011). Curr Pharm Biotechnol). In melanoma, TGF β pathway signaling activation has also been linked to resistance to BRAF and MEK inhibitors (Sun et. al. (2014) Nature. 508:118-122).

[0007] Many malignant cells secrete transforming growth factor- β (TGF- β), a potent immunosuppressant, suggesting that TGF β production may represent a significant tumor escape mechanism from host immunosurveillance (Flavell et. al. (2010) Nat Rev Immunol 10:554-567; Kast et. al. (1999) Leukemia 13:1188-1199). Establishment of a leukocyte sub-population with disrupted TGF β signaling in the tumor-bearing host offers a potential means for immunotherapy of cancer alone or in combination with one or more other immunotherapies, for example in combination with one or more PD-1 inhibitor such as nivolumab, pembrolizumab, PD-L1 inhibitors, cancer vaccines, and bispecific immune engaging molecules such as IMCgp100. TGF β ligand produced by lymphocytes has been shown preclinically to antagonize tumor immune surveillance (Donkor et. al. (2012) Development. Oncoimmunology 1:162-171, Donkor et. al. (2011) Cytokine Immunity 35:123-134); disrupting this axis preclinically has been shown to provide anti-tumor benefit in murine models and in vitro (Zhong et. al. (2010) Cancer Res 16:1191-1205; Petrusch et. al. (2009) J Immunol 183:3682-3689); Wakefield et. al. (2013) Nat. Rev Cancer 13:328-341). A bispecific fusion protein binding both TGF β and PD-L1 also exhibited synergistic antitumor activity compared to separate binding agents. Lan, et al., *Sci.*

Transl. Med. Vol. 10, 17 January 2018. A transgenic animal model with disrupted TGF β signaling in T cells is capable of eradicating a normally lethal TGF β over expressing lymphoma tumor, EL4 (Gorelik and Flavell, (2001) *Nature Medicine* 7(10): 1118-1122). Down regulation of TGF secretion in tumor cells results in restoration of immunogenicity in the host, while T-cell insensitivity to TGF β results in accelerated differentiation and autoimmunity, elements of which may be required in order to combat self-antigen-expressing tumors in a tolerized host. The immunosuppressive effects of TGF β have also been implicated in a subpopulation of HIV patients with lower than predicted immune response based on their CD4/CD8 T cell counts (Garba, et al. *J. Immunology* (2002) 168: 2247-2254). A TGF β neutralizing antibody was capable of reversing the effect in culture, indicating that TGF β signaling inhibitors may have utility in reversing the immune suppression present in this subset of HIV patients.

[0008] During the earliest stages of carcinogenesis, TGF β 1 can act as a potent tumor suppressor and may mediate the actions of some chemopreventive agents. However, at some point during the development and progression of malignant neoplasms, tumor cells appear to escape from TGF β -dependent growth inhibition in parallel with the appearance of bioactive TGF β in the microenvironment. The dual tumor suppression/tumor promotion roles of TGF β have been most clearly elucidated in a transgenic system overexpressing TGF β in keratinocytes. While the transgenics were more resistant to formation of benign skin lesions, the rate of metastatic conversion in the transgenics was dramatically increased (Cui, et al (1996) *Cell* 86(4):531-42).

[0009] The production of TGF β by malignant cells in primary tumors appears to increase with advancing stages of tumor progression. Studies in many of the major epithelial cancers suggest that the increased production of TGF β by human cancers occurs as a relatively late event during tumor progression. Further, this tumor-associated TGF β provides the tumor cells with a selective advantage and promotes tumor progression. The effects of TGF β on cell/cell and cell/stroma interactions result in a greater propensity for invasion and metastasis. Tumor-associated TGF may allow tumor cells to escape from immune surveillance since it is a potent inhibitor of the clonal expansion of activated lymphocytes. TGF β has also been shown to inhibit the production of angiostatin.

[0010] Cancer therapeutic modalities such as radiation therapy and chemotherapy induce the production of activated TGF β in the tumor, thereby selecting outgrowth of malignant cells that are resistant to TGF β growth inhibitory effects. Thus, these anticancer treatments increase the risk

and hasten the development of tumors with enhanced growth and invasiveness. In this situation, agents targeting TGF β -mediated signal transduction might be a very effective therapeutic strategy. The resistance of tumor cells to TGF β has been shown to negate much of the cytotoxic effects of radiation therapy and chemotherapy and the treatment-dependent activation of TGF β in the stroma may even be detrimental as it can make the microenvironment more conducive to tumor progression and contribute to tissue damage leading to fibrosis. The development of TGF β signal transduction inhibitors is likely to benefit the treatment of progressed cancer when used alone or in combination with other therapies.

[0011] Additionally, it is known in the art that TGF β signaling is involved in fibrotic conditions such as liver fibrosis and chronic kidney disease. See for example, Ueha S, et. al. 2012. *Front Immunol.* 3:71. Cellular and molecular mechanisms of chronic inflammation-associated organ fibrosis; Bottinger et al. 2002. *J Amer Soc Nephrol.* 13:2600. TGF β Signaling in Renal Disease; Trachtman H., et al. 2011. *Kidney International* 79:1236. A phase 1, single-dose study of fresolimumab, an anti- TGF β antibody, in treatment-resistant primary focal segmental glomerulosclerosis; and Rosenbloom J, et. al. 2010. Narrative review: fibrotic diseases: cellular and molecular mechanisms and novel therapies. *Ann Intern Med* 152: 159-166.

[0012] Small molecule inhibitors of TGF β R1 are known in the art for the treatment of cancer and/or fibrosis. See for example, WO2012/002680, WO2009/022171, WO2004/048382, WO2002/094833, and WO2016/057278. Unfortunately, the known classes of inhibitors have not resulted in any drugs reaching regulatory approval (although at least one, galunisertib, remains under investigation), likely because of the diverse bioactivities of TGF β R1, which can produce toxic responses at in vivo concentrations similar to those needed for therapeutic efficacy.

[0013] There remains a need for new small-molecule inhibitors of TGF β R1 useful for the treatment of cell proliferation disorders like cancer and fibrosis, and particularly for inhibitors having pharmacokinetic properties that can provide higher concentrations in organs or tissues to

be treated and lower effective concentrations in other tissues, whereby toxic effects in non-target tissues may be reduced. For example, small-molecule inhibitors could be administered orally to treat cancers in the digestive system, where they may interact directly with targeted tissues without need for systemic distribution. Similarly, these compounds may possess pharmacokinetic properties causing them to preferentially concentrate in target organs such as liver or kidneys, enabling them to be used to treat cancers in those organs, while the compounds may still be excreted relatively quickly before they fully enter systemic circulation, and thus do not produce high systemic drug concentrations that tend to produce toxicity elsewhere, e.g. in cardiac tissues.

[0014] The invention provides compounds that inhibit TGF β R1, also known as Alk5, and comprise an acidic moiety in a region of the structure where it does not interfere with binding to the target site. The compounds of the invention may be effective even if present only intermittently; thus long residence times (long in vivo half-life) and maintaining drug levels above a minimum inhibitory concentration (MIC) are not necessarily needed to achieve therapeutic efficacy, particularly when the compounds of the invention are used in combination with an additional anti-cancer therapeutic agent, including a PD-1 or PD-L1 inhibitor. These compounds are thus useful to treat cancers and fibrosis conditions in targeted tissues such as liver, kidney, and gastrointestinal system, while presenting reduced toxicity in non-targeted organs or tissues.

[0015] Without being bound by theory, the acidic moiety in compounds of Formula (I) and Formula (II) tends to reduce concentration of the drug in many tissues or promote relatively rapid excretion, while producing locally effective concentrations in e.g., the colon, small intestine, liver and/or kidneys, thus increasing the therapeutic index relative to non-acidic inhibitors of TGF β R1 for use in these organs. The increase in therapeutic index in these tissues is particularly advantageous for oral administration. The acidic compounds are also believed to be transported actively via transport polypeptides (e.g., OATP1, OATP2) into the tissues of the liver and kidneys, thus producing localized concentrations in those organs even when the compounds enter systemic circulation. In addition, since cancer of the colon often metastasizes to the liver; the compounds of the invention are also expected to inhibit metastasis by presenting locally high concentrations in both colon and liver tissues. The compounds of the invention are thus especially useful to treat colon cancer, hepatocellular carcinoma (HCC), renal cancer, liver

cancer, and gastric cancer, as well as fibrosis in the digestive system and first-pass metabolic systems, particularly liver fibrosis and kidney fibrosis conditions.

Detailed Description

[0029] Unless defined otherwise, all technical and scientific terms used herein have the same meaning as is commonly understood by one of ordinary skill in the art to which this invention belongs. All patents, applications, published applications and other publications referred to herein are incorporated by reference in their entireties. If a definition set forth in this section is contrary to or otherwise inconsistent with a definition set forth in a patent, application, or other publication that is herein incorporated by reference, the definition set forth in this section prevails over the definition incorporated herein by reference.

[0030] As used herein, “a” or “an” means “at least one” or “one or more”.

[0031] As used herein, the term “subject” refers to an animal. In certain aspects, the animal is a mammal. A subject also refers to for example, primates (*e.g.*, humans), cows, sheep, goats, horses, dogs, cats, rabbits, rats, mice, fish, birds and the like. In certain embodiments, the subject is a human. A “patient” as used herein refers to a human subject.

[0032] As used herein, the term “inhibit”, “inhibition” or “inhibiting” refers to the reduction or suppression of a given condition, symptom, or disorder, or disease, or a significant decrease in the baseline activity of a biological activity or process.

[0033] As used herein, the term “treat”, “treating” or “treatment” of any disease or disorder refers in one embodiment, to ameliorating the disease or disorder (*i.e.*, slowing or arresting or reducing the development of the disease or at least one of the clinical symptoms thereof). In another embodiment “treating” or “treatment” refers to alleviating or ameliorating at least one physical parameter including those which may not be discernible by the patient. In yet another embodiment, “treating” or “treatment” refers to modulating the disease or disorder, either physically, (*e.g.*, stabilization of a discernible symptom), physiologically, (*e.g.*, stabilization of a physical parameter), or both.

[0034] In yet another embodiment, “treating” or “treatment” refers to preventing or delaying the onset or development or progression of the disease or disorder.

[0035] As used herein, the term “a,” “an,” “the” and similar terms used in the context of the present invention (especially in the context of the claims) are to be construed to cover both the singular and plural unless otherwise indicated herein or clearly contradicted by the context.

[0036] “Optionally substituted” means the group referred to can be unsubstituted or can be substituted at one or more positions by any one or any combination of the radicals suitable for substitution on that group, or those specified. The number, placement and selection of substituents is understood to encompass only those substitutions that a skilled chemist would expect to be reasonably stable; thus ‘oxo’ would not be a substituent on an aryl or heteroaryl ring, for example, and a single carbon atom would not have three hydroxy or amino substituents.

[0037] “Halo” or “halogen”, as used herein, may be fluorine, chlorine, bromine or iodine.

[0038] “C₁-C₆ alkyl”, or “C₁₋₆ alkyl” as used herein, denotes straight chain or branched alkyl having 1-6 carbon atoms. If a different number of carbon atoms is specified, such as C₄ or C₃, then the definition is to be amended accordingly, such as “C₁-C₄ alkyl” will represent methyl, ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl and tert-butyl.

[0039] "C₁-C₆ alkoxy", or "C₁₋₆ alkoxy" as used herein, denotes straight chain or branched alkoxy having 1-6 carbon atoms. If a different number of carbon atoms is specified, such as C₄ or C₃, then the definition is to be amended accordingly, such as "C₁-C₄ alkoxy" will represent methoxy, ethoxy, propoxy, isopropoxy, butoxy, isobutoxy, sec-butoxy and tert-butoxy.

[0040] "C₁-C₄ haloalkyl" or "C₁₋₄ haloalkyl" as used herein, denotes straight chain or branched alkyl having 1-4 carbon atoms wherein at least one hydrogen has been replaced with a halogen. The number of halogen replacements can be from one up to the number of hydrogen atoms on the unsubstituted alkyl group. If a different number of carbon atoms is specified, such as C₆ or C₃, then the definition is to be amended accordingly. Thus "C₁-C₄ haloalkyl" will represent methyl, ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl and tert-butyl that have at least one hydrogen substituted with halogen, such as where the halogen is fluorine: CF₃CF₂-, (CF₃)₂CH-, CH₃-CF₂-, CF₃CF₂-, CF₃, CF₂H-, CF₃CF₂CHCF₃ or CF₃CF₂CF₂CF₂-.

[0041] "C₃-C₈ cycloalkyl" as used herein refers to a saturated monocyclic hydrocarbon ring of 3 to 8 carbon atoms. Examples of such groups include cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl. If a different number of carbon atoms is specified, such as C₃-C₆, then the definition is to be amended accordingly.

[0042] "3-6 membered cyclic ether" as used herein refers to a 3-6 membered saturated heterocyclic ring containing one oxygen atom as a ring member, including oxirane, oxetane, tetrahydrofuran, and tetrahydropyran. These 3-6 membered cyclic ethers can be substituted with groups suitable as substituents on other heterocyclic ring moieties.

[0064] All methods described herein can be performed in any suitable order unless otherwise indicated herein or otherwise clearly contradicted by context. The use of any and all

examples, or exemplary language (*e.g.* "such as") provided herein is intended merely to better illuminate the invention and does not pose a limitation on the scope of the invention otherwise claimed.

[0065] It should further be recognized that all of the above-defined groups may further be substituted with one or more substituents, which may in turn be substituted with hydroxy, amino, cyano, C₁-C₄ alkyl, halo, or C₁-C₄ haloalkyl. For example, a hydrogen atom in an alkyl or aryl can be replaced by an amino, halo or C₁-C₄ haloalkyl or alkyl group.

[0066] It is understood that in all substituted groups defined above, compounds arrived at by defining substituents with further substituents to themselves (*e.g.*, substituted aryl having a substituted aryl group as a substituent which is itself substituted with a substituted aryl group, which is further substituted by a substituted aryl group, etc.) are not intended for inclusion herein. In such cases, the maximum number of such substitutions is three. For example, serial substitutions of substituted aryl groups specifically contemplated herein are limited to substituted aryl-(substituted aryl)-substituted aryl.

[0067] As to any of the groups disclosed herein which contain one or more substituents, it is understood, of course, that such groups do not contain any substitution or substitution patterns which are sterically impractical and/or synthetically non-feasible. In addition, the subject compounds include all stereochemical isomers arising from the substitution of these compounds.

[0068] The term "an optical isomer" or "a stereoisomer" refers to any of the various stereoisomeric configurations which may exist for a given compound of the present invention and includes geometric isomers. It is understood that a substituent may be attached at a chiral center of a carbon atom. The term "chiral" refers to molecules which have the property of non-superimposability on their mirror image partner, while the term "achiral" refers to molecules which are superimposable on their mirror image partner. Therefore, the invention includes enantiomers, diastereomers or racemates of the compound. "Enantiomers" are a pair of stereoisomers that are non-superimposable mirror images of each other. A 1:1 mixture of a pair of enantiomers is a "racemic" mixture. The term is used to designate a racemic mixture where appropriate. "Diastereoisomers" are stereoisomers that have at least two asymmetric atoms, but which are not mirror-images of each other. The absolute stereochemistry is specified according to the Cahn-Ingold-Prelog R-S system. When a compound is a pure enantiomer the stereochemistry at each chiral carbon may be specified by either *R* or *S*. Resolved compounds whose absolute configuration is unknown can be designated (+) or (-) depending on the direction

(dextro- or levorotatory) which they rotate plane polarized light at the wavelength of the sodium D line. Certain compounds described herein contain one or more asymmetric centers or axes and may thus give rise to enantiomers, diastereomers, and other stereoisomeric forms that may be defined, in terms of absolute stereochemistry, as (R)- or (S)-.

[0069] Depending on the choice of the starting materials and procedures, the compounds can be present in the form of one of the possible isomers or as mixtures thereof, for example as pure optical isomers, or as isomer mixtures, such as racemates and diastereoisomer mixtures, depending on the number of asymmetric carbon atoms. The present invention is meant to include all such possible stereoisomers, including racemic mixtures, diastereomeric mixtures and optically pure forms except where otherwise specified. Optically active (R)- and (S)- isomers may be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques. If the compound contains a di- or tri-substituted double bond, the substituent may be E or Z configuration. If the compound contains a disubstituted cycloalkyl, the cycloalkyl substituents may have a cis- or trans-configuration. All tautomeric forms are also intended to be included.

[0070] Any resulting mixtures of isomers can be separated on the basis of the physicochemical differences of the constituents, into the pure or substantially pure geometric or optical isomers or diastereomers, for example, by chromatography and/or fractional crystallization.

[0071] Any resulting racemates of final products or intermediates can be resolved into the optical antipodes by known methods, e.g., by separation of the diastereomeric salts thereof, obtained with an optically active acid or base, and liberating the optically active acidic or basic compound. In particular, a basic moiety may thus be employed to resolve the compounds of the present invention into their optical antipodes, e.g., by fractional crystallization of a salt formed with an optically active acid, e.g., tartaric acid, dibenzoyl tartaric acid, diacetyl tartaric acid, di-*O,O'*-*p*-toluoyl tartaric acid, mandelic acid, malic acid or camphor-10-sulfonic acid. Racemic products can also be resolved by chiral chromatography, e.g., high pressure liquid chromatography (HPLC) using a chiral stationary phase, for example.

[0072] Furthermore, the compounds of the present invention, including their salts, can also be obtained in the form of their hydrates, or include other solvents used for their crystallization. The compounds of the present invention may inherently or by design form solvates with pharmaceutically acceptable solvents (including water); therefore, it is intended that the

invention embrace both solvated and unsolvated forms. The term "solvate" refers to a molecular complex of a compound of the present invention (including pharmaceutically acceptable salts thereof) with one or more acid, sulfuric acid, nitric acid, phosphoric acid, and the like.

[0073] Organic acids from which salts can be derived include, for example, acetic acid, propionic acid, glycolic acid, oxalic acid, maleic acid, malonic acid, succinic acid, fumaric acid, tartaric acid, citric acid, benzoic acid, mandelic acid, methanesulfonic acid, ethanesulfonic acid, toluenesulfonic acid, sulfosalicylic acid, and the like. Pharmaceutically acceptable base addition salts can be formed with inorganic and organic bases.

[0074] Inorganic bases from which salts can be derived include, for example, ammonium salts and metals from columns I to XII of the periodic table. In certain embodiments, the salts are derived from sodium, potassium, ammonium, calcium, magnesium, iron, silver, zinc, and copper; particularly suitable salts include ammonium, potassium, sodium, calcium and magnesium salts.

[0075] Organic solvent molecules. Such solvent molecules are those commonly used in the pharmaceutical art, which are known to be innocuous to the recipient, e.g., water, ethanol, and the like. The term "hydrate" refers to the complex where the solvent molecule is water.

[0076] The compounds of the present invention, including salts, hydrates and solvates thereof, may inherently or by design form polymorphs.

[0077] As used herein, the terms "salt" or "salts" refers to an acid addition or base addition salt of a compound of the present invention. "Salts" include in particular "pharmaceutically acceptable salts". The term "pharmaceutically acceptable salts" refers to salts that retain the biological effectiveness and properties of the compounds of this invention and, which typically are not biologically or otherwise undesirable. In many cases, the compounds of the present invention are capable of forming acid and/or base salts by virtue of the presence of amino and/or carboxyl groups or groups similar thereto.

[0078] Pharmaceutically acceptable acid addition salts can be formed with inorganic acids and organic acids, e.g., acetate, aspartate, benzoate, besylate, bromide/hydrobromide, bicarbonate/carbonate, bisulfate/sulfate, camphorsulfonate, chloride/hydrochloride, chlorthalophyllonate, citrate, ethandisulfonate, fumarate, gluceptate, gluconate, glucuronate, hippurate, hydroiodide/iodide, isethionate, lactate, lactobionate, laurylsulfate, malate, maleate, malonate, mandelate, mesylate, methylsulphate, naphthoate, napsylate, nicotinate, nitrate, octadecanoate, oleate, oxalate, palmitate, pamoate, phosphate/hydrogen phosphate/dihydrogen

phosphate, polygalacturonate, propionate, stearate, succinate, sulfosalicylate, tartrate, tosylate and trifluoroacetate salts.

[0079] Inorganic acids from which salts can be derived include, for example, hydrochloric acid, hydrobromic bases from which salts can be derived include, for example, primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines, basic ion exchange resins, and the like. Certain organic amines include isopropylamine, benzathine, choline, diethanolamine, diethylamine, lysine, meglumine, piperazine and tromethamine.

[0080] The pharmaceutically acceptable salts of the present invention can be synthesized from a basic or acidic moiety, by conventional chemical methods. Generally, such salts can be prepared by reacting free acid forms of these compounds with a stoichiometric amount of the appropriate base (such as Na, Ca, Mg, or K hydroxide, carbonate, bicarbonate or the like), or by reacting free base forms of these compounds with a stoichiometric amount of the appropriate acid. Such reactions are typically carried out in water or in an organic solvent, or in a mixture of the two. Generally, use of non-aqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile is desirable, where practicable. Lists of additional suitable salts can be found, e.g., in "Remington's Pharmaceutical Sciences", 20th ed., Mack Publishing Company, Easton, Pa., (1985); and in "Handbook of Pharmaceutical Salts: Properties, Selection, and Use" by Stahl and Wermuth (Wiley-VCH, Weinheim, Germany, 2002).

[0081] The compounds and compositions described herein can be administered to a subject in need of treatment for a cell proliferation disorder such as cancer or fibrosis, particularly cancers that occur in the gastrointestinal system and in the first-pass metabolic system organs and tissues.

[0082] The subject for treatment with compounds and pharmaceutical compositions of the invention is typically a mammal diagnosed as being in need of treatment for one or more of such proliferative disorders, and frequently the subject is a human. Typically, the subject is a patient diagnosed with a cancer associated with excessive activity of TGF β R1, also known as Alk5, particularly for cancers of the liver, kidneys and gastrointestinal system. The methods comprise administering an effective amount of at least one compound of the invention; optionally the compound may be administered in combination with one or more additional therapeutic agents, particularly therapeutic agents known to be useful for treating the cancer or proliferative disorder afflicting the particular subject.

[0083] Compounds of the invention may be used in the treatment of states, disorders or diseases as described herein, or for the manufacture of pharmaceutical compositions for use in the treatment of these diseases. The invention provides methods of use of compounds of the present invention in the treatment of these diseases or for preparation of pharmaceutical compositions having compounds of the present invention for the treatment of these diseases.

[0084] The term “pharmaceutical composition” includes preparations suitable for administration to mammals, e.g., humans. When the compounds of the present invention are administered as pharmaceuticals to mammals, e.g., humans, they can be given per se or as a pharmaceutical composition containing, for example, 0.1 to 99.5% (more preferably, 0.5 to 90%) of a compound of Formula (I) or Formula (II), or any subgenus thereof described herein as active ingredient in combination with a pharmaceutically acceptable excipient, and optionally two or more pharmaceutically acceptable excipients.

[0085] The phrase “pharmaceutically acceptable excipient” is understood by those of skill in the art, and includes a pharmaceutically acceptable material, composition or vehicle, suitable for administering compounds of the present invention to mammals. The excipients include liquid or solid filler, diluent, carrier, solvent or encapsulating material, involved in carrying or transporting the subject agent from one organ, or portion of the body, to another organ, or portion of the body, or in making the drug product more easily formulated, tableted, stored, used, or administered. Each excipient must be “acceptable” in the sense of being compatible with the other ingredients of the formulation and not injurious to the patient. Some examples of materials which can serve as pharmaceutically acceptable excipients include: sugars, such as lactose, glucose and sucrose; starches, such as corn starch and potato starch; cellulose, and its derivatives, such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; excipients, such as cocoa butter and suppository waxes; oils, such as peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil and soybean oil; glycols, such as propylene glycol; polyols, such as glycerin, sorbitol, mannitol and polyethylene glycol; esters, such as ethyl oleate and ethyl laurate; agar; buffering agents, such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water; isotonic saline; Ringer's solution; ethyl alcohol; phosphate buffer solutions; and other non-toxic compatible substances employed in pharmaceutical formulations. Typically, pharmaceutically acceptable excipients are sterilized and/or substantially pyrogen-free.

[0086] Wetting agents, emulsifiers and lubricants, such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, release agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the compositions.

[0087] Examples of pharmaceutically acceptable antioxidants include: water soluble antioxidants, such as ascorbic acid, cysteine hydrochloride, sodium bisulfate, sodium metabisulfite, sodium sulfite and the like; oil-soluble antioxidants, such as ascorbyl palmitate, butylated hydroxyanisole (BHA), butylated hydroxytoluene (BHT), lecithin, propyl gallate, α -tocopherol, and the like; and metal chelating agents, such as citric acid, ethylenediamine tetraacetic acid (EDTA), sorbitol, tartaric acid, phosphoric acid, and the like.

[0088] Formulations of the present invention include those suitable for oral, nasal, inhalation, topical, transdermal, buccal, sublingual, rectal, vaginal and/or parenteral administration. The formulations may conveniently be presented in unit dosage form and may be prepared by any methods well known in the art of pharmacy. The amount of active ingredient that can be combined with a carrier material to produce a single dosage form will generally be that amount of the compound that produces a therapeutic effect. Generally, out of one hundred per cent, this amount will range from about 1 per cent to about ninety-nine percent of active ingredient, preferably from about 5 per cent to about 70 per cent, most preferably from about 10 per cent to about 30 per cent.

[0089] Methods of preparing these formulations or compositions include the step of bringing into association a compound of the present invention with the carrier or excipient and, optionally, one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing into association a compound of the present invention with liquid excipient, or finely divided solid excipient, or both, and then, if necessary, shaping the product.

[0090] Formulations of the invention suitable for oral administration may be in the form of capsules, cachets, pills, tablets, lozenges (using a flavored base, for example, usually sucrose and acacia or tragacanth), powders, granules, or as a solution or a suspension in an aqueous or non-aqueous liquid, or as an oil-in-water or water-in-oil liquid emulsion, or as an elixir or syrup, or as pastilles (using an inert base, such as gelatin and glycerin, or sucrose and acacia) and/or as mouth washes and the like, each containing a predetermined amount of a compound of the

present invention as an active ingredient. A compound of the present invention may also be administered as a bolus, electuary or paste.

[0091] In solid dosage forms of the invention for oral administration (capsules, tablets, pills, dragees, powders, granules and the like), the active ingredient is mixed with one or more pharmaceutically acceptable excipients, such as sodium citrate or dicalcium phosphate, and/or any of the following: fillers or extenders, such as starches, lactose, sucrose, glucose, mannitol, and/or silicic acid; binders, such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinyl pyrrolidone, sucrose and/or acacia; humectants, such as glycerol; disintegrating agents, such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate; solution retarding agents, such as paraffin; absorption accelerators, such as quaternary ammonium compounds; wetting agents, such as, for example, cetyl alcohol and glycerol monostearate; absorbents, such as kaolin and bentonite clay; lubricants, such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof; and coloring agents. In the case of capsules, tablets and pills, the pharmaceutical compositions may also comprise buffering agents. Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugars, as well as high molecular weight polyethylene glycols and the like.

[0092] A tablet may be made by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared using binder (for example, gelatin or hydroxypropylmethyl cellulose), lubricant, inert diluent, preservative, disintegrant (for example, sodium starch glycolate or cross-linked sodium carboxymethyl cellulose), surface-active or dispersing agent. Molded tablets may be made by molding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent.

[0093] The tablets, and other solid dosage forms of the pharmaceutical compositions of the present invention, such as dragees, capsules, pills and granules, may optionally be scored or prepared with coatings and shells, such as enteric coatings and other coatings well known in the pharmaceutical-formulating art. They may also be formulated so as to provide slow or controlled release of the active ingredient therein using, for example, hydroxypropylmethyl cellulose in varying proportions to provide the desired release profile, other polymer matrices, liposomes and/or microspheres. They may be sterilized by, for example, filtration through a bacteria-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions

that can be dissolved in sterile water, or some other sterile injectable medium immediately before use. These compositions may also optionally contain opacifying agents and may be of a composition that they release the active ingredient(s) only, or preferentially, in a certain portion of the gastrointestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes. The active ingredient can also be in micro-encapsulated form, if appropriate, with one or more of the above-described excipients.

[0094] Liquid dosage forms for oral administration of the compounds of the invention include pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active ingredient, the liquid dosage forms may contain inert diluent commonly used in the art, such as, for example, water or other solvents, solubilizing agents and emulsifiers, such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor and sesame oils), glycerol, tetrahydrofuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof.

[0095] Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, coloring, perfuming and preservative agents.

[0096] Suspensions, in addition to the active compounds, may contain suspending agents as, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar and tragacanth, and mixtures thereof.

[0097] Formulations of the present invention which are suitable for vaginal administration also include pessaries, tampons, creams, gels, pastes, foams or spray formulations containing such carriers as are known in the art to be appropriate.

[0098] Dosage forms for the topical or transdermal administration of a compound of this invention include powders, sprays, ointments, pastes, creams, lotions, gels, solutions, patches and inhalants. The active compound may be mixed under sterile conditions with a pharmaceutically acceptable excipient, and with any preservatives, buffers, or propellants that may be required.

[0099] Powders and sprays can contain, in addition to a compound of this invention, excipients such as lactose, talc, silicic acid, aluminum hydroxide, calcium silicates and

polyamide powder, or mixtures of these substances. Sprays can additionally contain customary propellants, such as chlorofluorohydrocarbons and volatile unsubstituted hydrocarbons, such as butane and propane.

[00100] Ophthalmic formulations, eye ointments, powders, solutions and the like, are also contemplated as being within the scope of this invention.

[00101] Pharmaceutical compositions of this invention suitable for parenteral administration comprise one or more compounds of the invention in combination with one or more pharmaceutically acceptable carriers such as sterile isotonic aqueous or nonaqueous solutions, dispersions, suspensions or emulsions, or sterile powders which may be reconstituted into sterile injectable solutions or dispersions just prior to use, which may contain antioxidants, buffers, bacteriostats, solutes which render the formulation isotonic with the blood of the intended recipient or suspending or thickening agents.

[00102] Examples of suitable aqueous and nonaqueous carriers that may be employed in the pharmaceutical compositions of the invention include water, ethanol, glycol ethers, polyols (such as glycerol, propylene glycol, polyethylene glycol, and the like), and suitable mixtures thereof, vegetable oils, such as olive oil, and injectable organic esters, such as ethyl oleate. Proper fluidity can be maintained, for example, by the use of coating materials, such as lecithin, by the maintenance of the required particle size in the case of dispersions, and by the use of surfactants.

[00103] These compositions may also contain adjuvants such as preservatives, wetting agents, emulsifying agents and dispersing agents. Prevention of the action of microorganisms may be ensured by the inclusion of various antibacterial and antifungal agents, for example, paraben, chlorobutanol, phenol sorbic acid, and the like. It may also be desirable to include isotonic agents, such as sugars, sodium chloride, and the like into the compositions. In addition, prolonged absorption of the injectable pharmaceutical form may be brought about by the inclusion of agents that delay absorption such as aluminum monostearate and gelatin.

[00104] In some cases, in order to prolong the effect of a drug, it is desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material having poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a

parenterally-administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle.

[00105] The preparations of the present invention may be given orally, parenterally, topically, or rectally. They are of course given by forms suitable for each administration route. For example, they are administered in tablets or capsule form, by injection, inhalation, eye lotion, ointment, suppository, etc., administration by injection, infusion or inhalation; topical by lotion or ointment; and rectal by suppositories.

[00106] The phrases “parenteral administration” and “administered parenterally” as used herein means modes of administration other than enteral and topical administration, usually by injection, and includes, without limitation, intravenous, intramuscular, intraarterial, intrathecal, intracapsular, intraorbital, intracardiac, intradermal, intraperitoneal, transtracheal, subcutaneous, subcuticular, intraarticular, subcapsular, subarachnoid, intraspinal and intrasternal injection and infusion. Intravenous infusion is sometimes a preferred method of delivery for compounds of the invention. Infusion may be used to deliver a single daily dose or multiple doses. In some embodiments, a compound of the invention is administered by infusion over an interval between 15 minutes and 4 hours, typically between 0.5 and 3 hours. Such infusion may be used once per day, twice per day or up to three times per day.

[00107] These compounds may be administered to humans and other animals for therapy by any suitable route of administration, including orally, nasally, as by, for example, a spray, rectally, intravaginally, parenterally, intracisternally and topically, as by powders, ointments or drops, including buccally and sublingually.

[00108] Regardless of the route of administration selected, the compounds of the present invention, which may be used in a suitable hydrated form, and/or the pharmaceutical compositions of the present invention, are formulated into pharmaceutically acceptable dosage forms by conventional methods known to those of skill in the art.

[00109] Actual dosage levels of the active ingredients in the pharmaceutical compositions of this invention may be varied so as to obtain an amount of the active ingredient which is effective to achieve the desired therapeutic response for a particular patient, composition, and mode of administration, without being toxic to the patient.

[00110] The selected dosage level will depend upon a variety of factors including the activity of the particular compound of the present invention employed, or the ester, salt or amide thereof, the route of administration, the time of administration, the rate of excretion of the particular

compound being employed, the duration of the treatment, other drugs, compounds and/or materials used in combination with the particular compound employed, the age, sex, weight, condition, general health and prior medical history of the patient being treated, and like factors well known in the medical arts.

[00111] A physician or veterinarian having ordinary skill in the art can readily determine and prescribe the effective amount of the pharmaceutical composition required. For example, the physician or veterinarian could start doses of the compounds of the invention employed in the pharmaceutical composition at levels lower than that required in order to achieve the desired therapeutic effect and gradually increase the dosage until the desired effect is achieved.

[00112] In general, a suitable daily dose of a compound of the invention will be that amount of the compound that is the lowest dose effective to produce a therapeutic effect. Such an effective dose will generally depend upon the factors described above. Generally, intravenous and subcutaneous doses of the compounds of this invention for a patient, when used for the indicated effects, will range from about 0.0001 to about 100 mg per kilogram of body weight per day, more preferably from about 0.01 to about 50 mg per kg per day, and still more preferably from about 1.0 to about 100 mg per kg per day. An effective amount is an amount that achieves a desired or observable therapeutic effect.

[00113] If desired, the effective daily dose of the active compound may be administered as two, three, four, five, six or more sub-doses administered separately at appropriate intervals throughout the day, optionally, in unit dosage forms. Compounds delivered orally or by inhalation, are commonly administered in one to four doses per day. Compounds delivered by injection are typically administered once per day, or once every other day. Compounds delivered by infusion are typically administered in one to three doses per day.

[00114] While it is possible for a compound of the present invention to be administered alone, it is preferable to administer the compound as a pharmaceutical composition such as those described herein.

Formulations

[00123] Any suitable formulation of the compounds described herein can be prepared. *See generally*, Remington's Pharmaceutical Sciences, (2000) Hoover, J. E. editor, 20 th edition, Lippincott Williams and Wilkins Publishing Company, Easton, Pa., pages 780-857. A formulation is selected to be suitable for an appropriate route of administration. In cases where compounds are sufficiently acidic to form stable nontoxic base salts, administration of the compounds as salts may be appropriate. Examples of pharmaceutically acceptable salts are organic acid addition salts formed with acids that form a physiological acceptable anion, for

example, tosylate, methanesulfonate, acetate, citrate, malonate, tartarate, succinate, benzoate, ascorbate, α -ketoglutarate, and α -glycerophosphate. Suitable inorganic salts may also be formed, including hydrochloride, sulfate, nitrate, bicarbonate, and carbonate salts. Pharmaceutically acceptable salts are obtained using standard procedures well known in the art, for example, by a sufficiently basic compound such as an amine with a suitable acid, affording a physiologically acceptable anion. Alkali metal (*e.g.*, sodium, potassium or lithium) or alkaline earth metal (*e.g.*, calcium) salts, as well as amine salts of carboxylic acids and tetrazoles also are made.

[00124] Where contemplated compounds are administered in a pharmacological composition, it is contemplated that the compounds can be formulated in admixture with a pharmaceutically acceptable excipient and/or carrier. For example, contemplated compounds can be administered orally as neutral compounds or as pharmaceutically acceptable salts, or intravenously in a physiological saline solution. Conventional buffers such as phosphates, bicarbonates or citrates can be used for this purpose. Of course, one of ordinary skill in the art may modify the formulations within the teachings of the specification to provide numerous formulations for a particular route of administration. In particular, contemplated compounds may be modified to render them more soluble in water or other vehicle, which for example, may be easily accomplished with minor modifications (salt formulation, esterification, *etc.*) that are well within the ordinary skill in the art. It is also well within the ordinary skill of the art to select or modify the route of administration and dosage regimen of a particular compound in order to manage the pharmacokinetics of the present compounds for maximum beneficial effect in a patient.

[00125] The compounds having formula I-II as described herein are generally soluble in organic solvents such as chloroform, dichloromethane, ethyl acetate, ethanol, methanol, isopropanol, acetonitrile, glycerol, *N,N*-dimethylformamide, *N,N*-dimethylacetamide, dimethylsulfoxide, *etc.* In one embodiment, the present invention provides formulations prepared by mixing a compound having formula I-II with a pharmaceutically acceptable excipient. In one aspect, the formulation may be prepared using a method comprising: a) dissolving a described compound in a water-soluble organic solvent, a non-ionic solvent, a water-soluble lipid, a vitamin such as tocopherol, a fatty acid, a fatty acid ester, or a combination thereof, to provide a solution; and b) adding saline or a buffer containing 1-10% carbohydrate solution. In one example, the carbohydrate comprises dextrose. The

pharmaceutical compositions obtained using the present methods are stable and useful for animal and clinical applications.

[00126] Illustrative examples of water soluble organic solvents for use in the present methods include and are not limited to polyethylene glycol (PEG), alcohols, acetonitrile, *N*-methyl-2-pyrrolidone, *N,N*-dimethylformamide, *N,N*-dimethylacetamide, dimethyl sulfoxide, or a combination thereof. Examples of alcohols include but are not limited to methanol, ethanol, isopropanol, glycerol, or propylene glycol.

[00127] Illustrative examples of water soluble non-ionic surfactants for use in the present methods include and are not limited to CREMOPHOR[®] EL, polyethylene glycol modified CREMOPHOR[®] (polyoxyethyleneglyceroltriricinoleat 35), hydrogenated CREMOPHOR[®] RH40, hydrogenated CREMOPHOR[®] RH60, PEG-succinate, polysorbate 20, polysorbate 80, SOLUTOL[®] HS (polyethylene glycol 660 12-hydroxystearate), sorbitan monooleate, poloxamer, LABRAFIL[®] (ethoxylated persic oil), LABRASOL[®] (capryl-caproyl macrogol-8-glyceride), GELUCIRE[®] (glycerol ester), SOFTIGEN[®] (PEG 6 caprylic glyceride), glycerin, glycol-polysorbate, or a combination thereof.

[00128] Illustrative examples of water soluble lipids for use in the present methods include but are not limited to vegetable oils, triglycerides, plant oils, or a combination thereof. Examples of lipid oils include but are not limited to castor oil, polyoxyl castor oil, corn oil, olive oil, cottonseed oil, peanut oil, peppermint oil, safflower oil, sesame oil, soybean oil, hydrogenated vegetable oil, hydrogenated soybean oil, a triglyceride of coconut oil, palm seed oil, and hydrogenated forms thereof, or a combination thereof.

[00129] Illustrative examples of fatty acids and fatty acid esters for use in the present methods include but are not limited to oleic acid, monoglycerides, diglycerides, a mono- or di-fatty acid ester of PEG, or a combination thereof.

[00130] One of ordinary skill in the art may modify the formulations within the teachings of the specification to provide numerous formulations for a particular route of administration. In particular, the compounds may be modified to render them more soluble in water or other vehicle. It is also well within the ordinary skill of the art to modify the route of administration and dosage regimen of a particular compound in order to manage the pharmacokinetics of the present compounds for maximum beneficial effect in a patient.

Drug combinations

[00131] The methods of the embodiments comprise administering an effective amount of at least one exemplary compound of the present disclosure; optionally the compound may be administered in combination with one or more additional therapeutic agents, particularly therapeutic agents known to be useful for treating the condition or disease afflicting the subject.

[00132] The additional active ingredients may be administered in a separate pharmaceutical composition from at least one exemplary compound of the present disclosure or may be included with at least one exemplary compound of the present disclosure in a single pharmaceutical composition. The additional active ingredients may be administered simultaneously with, prior to, or after administration of at least one exemplary compound of the present disclosure.

Methods of using the exemplary compounds and pharmaceutical compositions thereof

[00133] The present invention also provides pharmaceutical compositions for the treatment and/or prevention of a proliferation disorder or cancer such as those disclosed herein, comprising any compound having formula I or II, or any of the compounds of Examples 1-110 herein.

[00134] To practice the method of the present invention, compounds having formula and pharmaceutical compositions thereof may be administered orally, parenterally, by inhalation, topically, rectally, nasally, buccally, vaginally, via an implanted reservoir, or other drug administration methods. The term "parenteral" as used herein includes subcutaneous, intracutaneous, intravenous, intramuscular, intraarticular, intraarterial, intrasynovial, intrasternal, intrathecal, intralesional and intracranial injection or infusion techniques.

[00135] A sterile injectable composition, such as a sterile injectable aqueous or oleaginous suspension, may be formulated according to techniques known in the art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent. Among the acceptable vehicles and solvents that may be employed include mannitol, water, Ringer's solution and isotonic sodium chloride solution. Suitable carriers and other pharmaceutical excipient are typically sterile.

[00136] In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium (*e.g.*, synthetic mono- or diglycerides). Fatty acids, such as oleic acid and its glyceride derivatives, are useful in the preparation of injectables, as are pharmaceutically acceptable oils,

such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions can also contain a long-chain alcohol diluent or dispersant, or carboxymethyl cellulose or similar dispersing agents. Various emulsifying agents or bioavailability enhancers which are commonly used in the manufacture of pharmaceutically acceptable solid, liquid, or other dosage forms can also be used for the purpose of formulation.

[00137] A composition for oral administration may be any orally acceptable dosage form including, but not limited to, tablets, capsules, emulsions and aqueous suspensions, dispersions and solutions. In the case of tablets for oral use, commonly used carriers include lactose and corn starch. Lubricating agents, such as magnesium stearate, can also be added. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions or emulsions are administered orally, the active ingredient can be suspended or dissolved in an oily phase combined with emulsifying or suspending agents. If needed, certain sweetening, flavoring, or coloring agents can be added. A nasal aerosol or inhalation compositions can be prepared according to techniques well-known in the art of pharmaceutical formulation and can be prepared as solutions in, for example saline, employing suitable preservatives (for example, benzyl alcohol), absorption promoters to enhance bioavailability, and/or other solubilizing or dispersing agents known in the art.

[00138] In addition, the compounds having formula I or Formula (II) or any of the subformulae thereof, may be administered alone or in combination with other therapeutic agents, *e.g.*, anticancer agents, for the treatment of a subject in need of treatment. Combination therapies according to the present invention comprise the administration of at least one exemplary compound of Formula (I) or Formula (II) or any subformulae thereof as disclosed herein and at least one additional pharmaceutically active ingredient. The compound of the invention and additional pharmaceutically active agents may be administered separately or together. The amounts of the compound of the invention and of the additional pharmaceutically active agent(s) and the relative timings of administration will be selected in order to achieve the desired combined therapeutic effect.

The compounds as described herein may be synthesized by the general synthetic routes below, specific examples of which are described in more detail in the Examples.

[00139] Within the scope of this text, only a readily removable group that is not a constituent of the particular desired end product of the compounds of the present invention is designated a “protecting group,” unless the context indicates otherwise. The protection of functional groups

by such protecting groups, the protecting groups themselves, and their cleavage reactions are described for example in standard reference works, such as e.g., Science of Synthesis: Houben-Weyl Methods of Molecular Transformation. Georg Thieme Verlag, Stuttgart, Germany. 2005. 41627 pp. (URL: <http://www.science-of-synthesis.com> (Electronic Version, 48 Volumes)); J. F. W. McOmie, "Protective Groups in Organic Chemistry", Plenum Press, London and New York 1973, in T. W. Greene and P. G. M. Wuts, "Protective Groups in Organic Synthesis", Third edition, Wiley, New York 1999, in "The Peptides"; Volume 3 (editors: E. Gross and J. Meienhofer), Academic Press, London and New York 1981, in "Methoden der organischen Chemie" (Methods of Organic Chemistry), Houben Weyl, 4th edition, Volume 15/I, Georg Thieme Verlag, Stuttgart 1974, in H.-D. Jakubke and H. Jeschkeit, "Aminosäuren, Peptide, Proteine" (Amino acids, Peptides, Proteins), Verlag Chemie, Weinheim, Deerfield Beach, and Basel 1982, and in Jochen Lehmann, "Chemie der Kohlenhydrate: Monosaccharide und Derivate" (Chemistry of Carbohydrates: Monosaccharides and Derivatives), Georg Thieme Verlag, Stuttgart 1974. A characteristic of protecting groups is that they can be removed readily (i.e., without the occurrence of undesired secondary reactions) for example by solvolysis, reduction, photolysis or alternatively under physiological conditions (e.g., by enzymatic cleavage).

[00140] Salts of compounds of the present invention having at least one salt-forming group may be prepared in a manner known per se. For example, salts of compounds of the present invention having acid groups may be formed, for example, by treating the compounds with metal compounds, such as alkali metal salts of suitable organic carboxylic acids, e.g., the sodium salt of 2-ethyl hexanoic acid, with organic alkali metal or alkaline earth metal compounds, such as the corresponding hydroxides, carbonates or hydrogen carbonates, such as sodium or potassium hydroxide, carbonate or hydrogen carbonate, with corresponding calcium compounds or with ammonia or a suitable organic amine, stoichiometric amounts or only a small excess of the salt-forming agent preferably being used. Acid addition salts of compounds of the present invention are obtained in customary manner, e.g., by treating the compounds with an acid or a suitable anion exchange reagent. Internal salts of compounds of the present invention containing acid and basic salt-forming groups, e.g., a free carboxy group and a free amino group, may be formed, e.g., by the neutralisation of salts, such as acid addition salts, to the isoelectric point, e.g., with weak bases, or by treatment with ion exchangers.

[00141] Salts can be converted in customary manner into the free compounds; metal and ammonium salts can be converted, for example, by treatment with suitable acids, and acid addition salts, for example, by treatment with a suitable basic agent.

[00142] Mixtures of isomers obtainable according to the invention can be separated in a manner known per se into the individual isomers; diastereoisomers can be separated, for example, by partitioning between polyphasic solvent mixtures, recrystallisation and/or chromatographic separation, for example over silica gel or by, e.g., medium pressure liquid chromatography over a reversed phase column, and racemates can be separated, for example, by the formation of salts with optically pure salt-forming reagents and separation of the mixture of diastereoisomers so obtainable, for example by means of fractional crystallisation, or by chromatography over optically active column materials.

[00143] Intermediates and final products can be worked up and/or purified according to standard methods, e.g., using chromatographic methods, distribution methods, (re-) crystallization, and the like.

[00144] The process steps to synthesize the compounds of the invention can be carried out under reaction conditions that are known per se, including those mentioned specifically, in the absence or, customarily, in the presence of solvents or diluents, including, for example, solvents or diluents that are inert towards the reagents used and dissolve them, in the absence or presence of catalysts, condensation or neutralizing agents, for example ion exchangers, such as cation exchangers, e.g., in the H⁺ form, depending on the nature of the reaction and/or of the reactants at reduced, normal or elevated temperature, for example in a temperature range of from about -100 °C to about 190°C, including, for example, from approximately -80°C to approximately 150°C, for example at from -80 to -60°C, at room temperature, at from -20 to 40°C or at reflux temperature, under atmospheric pressure or in a closed vessel, where appropriate under pressure, and/or in an inert atmosphere, for example under an argon or nitrogen atmosphere.

[00145] At all stages of the reactions, mixtures of isomers that are formed can be separated into the individual isomers, for example diastereoisomers or enantiomers, or into any desired mixtures of isomers, for example racemates or mixtures of diastereoisomers, for example analogously to the methods described in *Science of Synthesis: Houben-Weyl Methods of Molecular Transformation*, Georg Thieme Verlag, Stuttgart, Germany, 2005.

[00146] The solvents from which those solvents that are suitable for any particular reaction may be selected include those mentioned specifically or, for example, water, esters, such as

lower alkyl-lower alkanooates, for example ethyl acetate, ethers, such as aliphatic ethers, for example diethyl ether, or cyclic ethers, for example tetrahydrofuran or dioxane, liquid aromatic hydrocarbons, such as benzene or toluene, alcohols, such as methanol, ethanol or 1- or 2-propanol, nitriles, such as acetonitrile, halogenated hydrocarbons, such as methylene chloride or chloroform, acid amides, such as dimethylformamide or dimethyl acetamide, bases, such as heterocyclic nitrogen bases, for example pyridine or N-methylpyrrolidin-2-one, carboxylic acid anhydrides, such as lower alkanooic acid anhydrides, for example acetic anhydride, cyclic, linear or branched hydrocarbons, such as cyclohexane, hexane or isopentane, or mixtures of those solvents, for example aqueous solutions, unless otherwise indicated in the description of the processes. Such solvent mixtures may also be used in working up, for example by chromatography or partitioning.

[00147] The compounds, including their salts, may also be obtained in the form of hydrates, or their crystals may, for example, include the solvent used for crystallization. Different crystalline forms may be present.

[00148] The invention relates also to those forms of the process in which a compound obtainable as an intermediate at any stage of the process is used as starting material and the remaining process steps are carried out, or in which a starting material is formed under the reaction conditions or is used in the form of a derivative, for example in a protected form or in the form of a salt, or a compound obtainable by the process according to the invention is produced under the process conditions and processed further in situ.

[00149] In accordance with the foregoing the present invention provides in a yet further aspect:

[00150] A pharmaceutical combination comprising a) a first agent which is a compound of the invention, e.g. a compound of Formula (I) or Formula (II) or any subformulae thereof, and b) a co-agent, e.g. an additional pharmaceutically active agent as defined above.

[00151] A method as defined above comprising co-administration, e.g. concomitantly or in sequence, of a therapeutically effective amount of a compound of the invention, e.g. a compound of formula I or formula (II) or any subformulae thereof, and a co-agent, e.g. an additional therapeutic agent as defined above.

[00152] The terms “co-administration” or “combined administration” or the like as utilized herein are meant to encompass administration of the selected therapeutic agents to a single patient, and are intended to include treatment regimens in which the agents are not

necessarily administered by the same route of administration or at the same time. Fixed combinations are also within the scope of the present invention. The administration of a pharmaceutical combination of the invention results in a beneficial effect, e.g. a synergistic therapeutic effect, compared to a monotherapy applying only one of its pharmaceutically active ingredients.

[00153] Each component of a combination according to this invention may be administered separately, together, or in any combination thereof.

[00154] The compound of the invention and any additional agent may be formulated in separate dosage forms. Alternatively, to decrease the number of dosage forms administered to a patient, the compound of the invention and any additional agent may be formulated together in any combination. For example, the compound of the invention inhibitor may be formulated in one dosage form and the additional agent may be formulated together in another dosage form. Any separate dosage forms may be administered at the same time or different times.

[00155] Alternatively, a composition of this invention comprises an additional agent as described herein. Each component may be present in individual compositions, combination compositions, or in a single composition.

[00156] The compounds of the invention can be produced by organic synthesis methods known to one of ordinary skill in the art with reference to the following reaction schemes and examples. General methods for synthesis of compounds of Formula (I) and Formula (II) are provided in Schemes 1-3 below.

General Synthetic Procedures

[00157] Compounds of the present invention are prepared from commonly available compounds using procedures known to those skilled in the art in view of the examples and schemes provided herein.

Scheme 1.

[00158] In Scheme 1, Ring A, substituted by an amino group and linked with an ester, is coupled to a chloropyridine. The ester can be hydrolyzed to provide a free carboxylic acid. Depending on the choice of R, the product can be a compound of Formula (I) or Formula (II) or a precursor to such compounds. Ring A corresponds to, e.g., the group Cy in compounds of Formula (I), or to a phenyl/pyridinyl ring in compounds of Formula (II).

Scheme 2.

[00159] In Scheme 2, Ring A has an amino group and is linked with a nitrile; after coupling with the chloropyridine, the nitrile can be converted into a carboxylate group by hydrolysis, or it can be converted with trimethylsilyl azide to an acidic tetrazole group. Again, depending on the choice of R, the product can be a compound of Formula (I) or Formula (II) or a precursor to such compounds.

Scheme 3.

[00160] In Scheme 3, a tetrazole product of Scheme 2 is alkylated with t-butyl bromoacetate to provide two isomeric carboxymethyl tetrazole products. Again, depending on the choice of R, the product can be a compound of Formula (I) or Formula (II), or a precursor to such compounds.

[00161] Using these and known alternative starting materials, the skilled person can prepare a wide variety of compounds of Formula (I) or Formula (II) having either a carboxylate or tetrazole as an acidic group.

[00162] The compound was prepared following the procedure published in WO2005080377.

[00163] Step 1: (4,5-dimethylfuran-2-yl)(pyridin-2-yl)methanone

[00164] Under Ar, to a solution of 2,3-dimethylfuran (1.0 eq) in Et₂O (0.65 M) was added dropwise n-BuLi (1.6 M, 1.3 eq) at 0 °C. The mixture was stirred at 40 °C for 1.5 h and then cooled to -78 °C. A solution of picolinonitrile (1.0 eq) in Et₂O (2 M) was added dropwise thereto. The resulting mixture was stirred at r.t. for 1.5 h before quenched with ice. The pH

Example 174: 3-(3-((4-((6-ethyl-2,5-dimethylpyridin-3-yl)oxy)pyridin-2-yl)amino)benzyl)oxetane-3-carboxylic acid

Step 1: 3-(3-((4-((6-ethyl-2,5-dimethylpyridin-3-yl)oxy)pyridin-2-yl)amino)benzyl)oxetane-3-carbonitrile

[00429] A mixture of 3-((2-chloropyridin-4-yl)oxy)-6-ethyl-2,5-dimethylpyridine (Intermediate A49, 1.0 eq), 3-(3-aminobenzyl)oxetane-3-carbonitrile (Intermediate B33, 1.0 eq), Cs_2CO_3 (2.0 eq), Xantphos (0.2 eq) and $\text{Pd}(\text{OAc})_2$ (0.2 eq) in dioxane (0.06 M) was stirred at 110 °C for 16 h under Ar. The mixture was filtered through a pad of celite, and the filtrate was concentrated. The residue was redissolved in EtOAc, washed with water, brine, and then dried over Na_2SO_4 . The crude product was purified by flash chromatography on silica gel (eluent: petroleum ether/EtOAc = 10:1 to 2:1) to give the title compound as a yellow solid. LC-MS (m/z): $[\text{M}+\text{H}]^+ = 415.2$.

Step 2: 3-(3-((4-((6-ethyl-2,5-dimethylpyridin-3-yl)oxy)pyridin-2-yl)amino)benzyl)oxetane-3-carboxylic acid

[00430] A mixture of 3-(3-((4-((6-ethyl-2,5-dimethylpyridin-3-yl)oxy)pyridin-2-yl)amino)benzyl)oxetane-3-carbonitrile (1.0 eq) and KOH (5.0 eq) in ethylene glycol/ H_2O ($v/v = 4:1$, 0.02 M) was stirred at 130 °C for 2 h. The mixture was cooled to RT, washed with EtOAc. The aqueous layer was adjusted to pH ~7 with 1.0 M aq. HCl, and the solvent was removed under reduced pressure. The residue was purified by Prep-HPLC (mobile phase: 0.1% $\text{HCOOH}/\text{MeCN}/\text{H}_2\text{O}$) to give the title compound as a white solid. LC-MS (m/z): $[\text{M}+\text{H}]^+ = 434.2$; ^1H NMR (400 MHz, CD_3OD) δ 7.97 (d, $J = 6.0$ Hz, 1H), 7.33 (s, 1H), 7.27-7.25 (m, 2H), 7.17 (t, $J = 7.6$ Hz, 1H), 6.83 (d, $J = 7.6$ Hz, 1H), 6.38 (dd, $J = 6.0, 2.0$ Hz, 1H), 6.10 (d, $J = 1.6$ Hz, 1H), 4.84 (d, $J = 6.4$ Hz, 2H), 4.60 (d, $J = 6.0$ Hz, 2H), 3.27 (s, 2H), 2.82 (q, $J = 7.6$ Hz, 2H), 2.34 (s, 6H), 1.24 (t, $J = 7.6$ Hz, 3H).

The solid was filtered off, and the filtrate was concentrated. The residue was purified by flash chromatography on silica gel (eluent: petroleum ether/EtOAc = 20:1) to give the title compound as a yellow solid. LC-MS (*m/z*): [M+1]⁺=422.3.

Step 2: *N*-(3-(2-(2*H*-tetrazol-5-yl)ethyl)phenyl)-4-((6-ethyl-[2,2'-bipyridin]-3-yl)oxy)pyridin-2-amine

Assays:

[00436] HEK-Blue TGF β cellular reporter gene assay:

[00437] HEK-Blue TGF β cell was purchased from Invivogen. Cell suspension of 2.5×10^5 cells/ml was prepared using Test Medium (DMEM containing 0.5% v/v heat-inactivated FBS). TGF- β working solution (6 ng/ml) was obtained through diluting TGF- β stock solution (10 μ g/ml) by Test Medium before use. Eight different concentrations of all compounds were obtained by 3 $\times$ gradient dilution method using TGF- β working solution. Add 100 μ l of Test Medium (Vehicle) or test article or TGF- β working solution per well of a flat-bottom 96-well plate. Add 100 μ l of HEK-Blue TGF- β cell suspension per well. Incubate the plate at 37 °C in a CO₂ incubator for 22~23 h. Add 150 μ l of resuspended QUANTI-Blue per well of a new flat-bottom 96-well plate. Add 30 μ l of induced HEK-Blue TGF- β cells supernatant. Avoid pipetting at the bottom of wells. Incubate the plate at 37 °C incubator for 30~40 min. Determine secreted embryonic alkaline phosphatase (SEAP) levels using a spectrophotometer at 630 nm.

[00438] The inhibition was calculated using the equation:

$$\text{Inhibition rate(\%)} = \frac{(TGF\beta - Vehicle) - (Compound - Vehicle)}{TGF\beta - Vehicle} \times 100\%$$

[00440] Comparing AUC_{liver}/AUC_{heart} ratio of selected Examples with clinic compounds Galunisertib and LY3200882. Tissue exposure was measured in Balb/c mouse with PO dosing at 10 mpk. Note that cardiac toxicity was identified as the most relevant for LY3200882 and as a limiting factor for galunisertib. See Stauber, et al., J. Clin. Pract., **2014**, 4(3), 196.

General PK protocol:

[00441] The Balb/c mice were fasted overnight with free access to drinking water prior to treatment. Compounds were formulated in 0.5% CMC/0.5% Tween 80 with or without 1 eq. of NaOH, and administered intragastrically at 10 mg/Kg. The liver and heart tissues of mice were collected at time points 0.5, 1, 3, 5, 7, 24h (2 mice per time point) post dose by first sacrificing the animal by CO₂ inhalation. After flushing with ice saline and removal of excess water on its surface, the liver and heart tissues were weighed and homogenized in 1:5 volumes (w/v) of water with 20% methanol. Tissue samples were kept at -40 ~ -20 °C prior to analysis. Concentrations of compounds in the liver and hearts were determined using an established liquid chromatography-tandem mass spectrometry (LC-MS/MS) method. Tissue concentration-time data were processed by linear regression analysis. All pharmacokinetic parameters were calculated using non-compartment model of Pharsight Phoenix 8.0.

[00442] As the data shows, the compounds of the invention are much more prone to concentrate in the liver than in cardiac tissue when compared to galunisertib or LY3200882, and are thus better able to provide a useful safety margin and therapeutic index than the known compounds. Since cardiotoxicity is a major concern when developing a new drug, the compounds of the invention, which exhibit potent in vitro activity on the target site and significantly better pharmacokinetic properties to promote safety, are shown to be superior to the compounds known in the art.

However, the invention described and claimed herein is not to be limited in scope by the specific embodiments herein disclosed because these embodiments are intended as illustration of several aspects of the invention. Any apparent alternative or additional embodiments are intended to be within the scope of this invention. Indeed, various modifications of the invention in addition to those shown and described herein will become apparent to those skilled in the art from the foregoing description which do not depart from the spirit or scope of the present inventive discovery. Such modifications are also intended to fall within the scope of the appended claims.
