(54) Title: FENCE PANEL SUPPORT FOOT

(57) Abstract: The present invention provides a fencing panel support foot, of the type arranged for supporting fencing panels in an upright-erected manner on a floor surface. The support foot includes a footing block of sufficient weight and dimensions such as to prevent toppling-over of an upright fencing panel when mounted to the footing block and when the panel is subjected to pre-determined forces normal to the panel's expanse; and three or more mounting receptacles each adapted to receive an upright mounting pole of a fencing panel to be supported at the footing block; wherein the mounting receptacles are arranged in one or more clusters at the footing block, each cluster having at least three said mounting receptacles situated in such close proximity that the upright mounting poles of the fencing panels received therein maintain a predetermined gap between them and provide a common anchoring location for three or more fencing panels in close proximity to each other.
